Revised 10-2007

LGA/LCA/LHA
13 / 15 / 17.5 / 20 / 25 TON
46 / 53 / 62 / 70 / 88 kW

LGA / LCA / LHA SERIES

The LGA / LCA / LHA 13, 15, 17.5, 20 and 25 ton (46, 53, 62, 70 and 88 kW) units are configure to order units (CTO) with a wide selection of factory installed options. The LGA180/210/240/300S gas/electric packaged rooftop units are available in 260,000 Btuh or 470,000 Btuh (76.2 kW or 137.7 kW) heating inputs. The LGA156H is available in 260,000 Btuh only. LGA240H is the only model available in 360,000 BTUH (105.5 kW) Gas heat sections are designed with Lennox' aluminized steel tube heat exchangers. The LCA156H/180/210/240/300S cooling packaged rooftop units are equipped with the same cooling sections as the LGA156H/180/210/240/300S units. Optional electric heat is factory-or field-installed in LCA units. Electric heat operates in single or multiple stages depending on the kW input size. 15kW through 60kW heat sections are available for the LCA156H and LCA180 and 15kW through 90kW heat sections are available for the LCA210/240/300S. LGA and LCA units have identical refrigerant circuits with 13, 15, 17.5, 20 or 25 ton (46, 53, 62, 70 or 88 kW) cooling capacities. LGA/LCA156H/180 units utilize three compressors, while the LGA/LCA210,240 and 300S units utilize four compressors.

The LGA/LCA240H4 is designed for R410A refrigerant. Operating pressures and pressure switch settings are higher than R22 charged units. Service equipment must be rated for R410A.

The LHA180 and 240 packaged heat pump units are available in 188,000 Btuh through 220,000 Btuh (55.1 kW through 64.5 kW) heating outputs and 15 or 20-ton (52.8 or 70.3 kW) cooling capacities. The LHA180/240 refrigerant systems utilize two compressors, two reversing valves, two accumulators, and other parts common to a heat pump. Optional auxiliary electric heat is factory-or field-installed in LHA units. Electric heat operates in single or multiple stages depending on the kW input size. 15kW through 60kW heat sections are available for the LHA180 and 15kW through 90kW heat sections are available for the LHA240.

If the unit must be lifted for service, rig unit by attaching four cables to the holes located in the unit base rail (two holes at each corner). Refer to the installation instructions for the proper rigging technique.

Information contained in this manual is intended for use by qualified service technicians only. All specifications are subject to change. Procedures outlined in this manual are presented as a recommendation only and do not supersede or replace local or state codes.

Electrical characteristics			208/230v, 460v or 575v — 60 hertz — 3 phase				

[1] Using total air volume and system static pressure requirements determine from blower performance tables rpm and motor output required. Maximum usable output of motors furnished by Lennox are shown. In Canada, nominal motor output is also maximum usable motor output. If motors of comparable output are used, be sure to keep within the service factor limitations outlined on the motor nameplate.

★Rated in accordance with ARI Standard 340/360 and certified to ARI; 95°F (35°C) outdoor air temperature and 80°F (27°C) db/67°F (19°C) wb entering evaporator air; minimum external duct static pressure. Integrated Part Load Value tested at 80°F (27°C) outdoor air temperature.

NOTE — ARI capacity is net and includes evaporator blower motor heat deduction. Gross capacity does not include evaporator blower motor heat deduction.

	Condensate Drain - number and size		(1) 1 in. NPT coupling		
	Expansion device type		Balanced Port Thermostatic Expansion Valve, removeable power head		
[3] **Indoor Blower and Drive Selection**	Nominal motor output		5 hp (3.7 kW) - 7.5 hp (5.6 kW) - 10 hp (7.5 kW)		
	Max. usable motor output (US Only)		5.75 hp (4.3 kW) - 8.63 hp (6.4 kW) - 11.5 hp (8.6 kW)		
	Motor - Drive kit		5 hp kit #2 - 685 - 865 rpm kit #3 - 850 - 1045 rpm kit #4 945 - 1185 rpm 7.5 hp kit #5 - 945 - 1185 rpm kit #6 - 1045 - 1285 rpm kit #7 - 850 - 1045 rpm 10 hp kit #6 - 1045-1285 rpm kit #8 - 1135-1365 rpm		
	Blower wheel nominal dia. x width		(2) 15 x 15 in. (381 x 381 mm)		
Filters	Type of filter		Disposable		
	Number and size - in. (mm)		(6) 24 x 24 x 2 (610x610x51)		
Electrical characteristics			208/230V, 460V or 575V - 60 hertz - 3 phase		

NOTE - Net capacity includes evaporator blower motor heat deduction. Gross capacity does not include evaporator blower motor heat deduction.

[1] Certified in accordance with the ULE certification program, which is based on ARI Standard 340/360; 95°F (35°C) outdoor air temperature and 80°F (27°C) db/67°F (19°C) wb entering evaporator air; minimum external duct static pressure.

[2] Integrated Part Load Value tested at 80°F (27°C) outdoor air temperature.

[3] Using total air volume and system static pressure requirements determine from blower performance tables rpm and motor output required. Maximum usable output of motors furnished by Lennox are shown. In Canada, nominal motor output is also maximum usable motor output. If motors of comparable output are used, be sure to keep within the service factor limitations outlined on the motor nameplate.

NOTE - Using total air volume and system static pressure requirements determine from blower performance tables rpm and motor output required. Maximum usable output of motors furnished by Lennox are shown. In Canada, nominal motor output is also maximum usable motor output. If motors of comparable output are used, be sure to keep within the service factor limitations outlined on the motor nameplate.

BLOWER DATA LGA UNITS

BLOWER TABLE INCLUDES RESISTANCE FOR BASE UNIT WITH STANDARD GAS HEAT, WET INDOOR COIL & AIR FILTERS IN PLACE.
FOR ALL UNITS ADD:

1 - Any factory installed options air resistance (high gas heat, economizer, etc.). See table below
2 - Any field installed accessories air resistance (duct resistance, diffuser, etc.). See Page 29

Then determine from table the blower motor output and drive required.

BLOWER TABLE INCLUDES RESISTANCE FOR BASE UNIT WITH STANDARD GAS HEAT, WET INDOOR COIL & AIR FILTERS IN PLACE.
FOR ALL UNITS ADD:

1 - Any factory installed options air resistance (high gas heat, economizer, etc.). See table below
2 - Any field installed accessories air resistance (duct resistance, diffuser, etc.). See Page 29

Then determine from table the blower motor output and drive required.

BLOWER DATA LCA UNITS

BLOWER TABLE INCLUDES RESISTANCE FOR BASE UNIT ONLY WITH DRY INDOOR COIL & AIR FILTERS IN PLACE.

FOR ALL UNITS ADD:

1 - Wet indoor coil air resistance of selected unit.
2 - Any factory installed options air resistance (heat section, economizer, etc.)
3 - Any field installed accessories air resistance (duct resistance, diffuser, etc.)

Then determine from blower table blower motor output and drive required.

See Page 28 for wet coil and option/accessory air resistance data.
See Page 20 for factory installed drive kit specifications.

BLOWER DATA LHA UNITS

15 and 20 TON (180 and 240)

BLOWER TABLE INCLUDES RESISTANCE FOR BASE UNIT ONLY WITH DRY INDOOR COIL & AIR FILTERS IN PLACE.

FOR ALL UNITS ADD:

1 - Wet indoor coil air resistance of selected unit.
2 - Any factory installed options air resistance (heat section, economizer, etc.)
3 - Any field installed accessories air resistance (duct resistance, diffuser, etc.)

Then determine from blower table blower motor output and drive required.

See Page 28 for wet coil and option/accessory air resistance data.
See Page 20 for factory installed drive kit specifications.

MINIMUM AIR VOLUME REQUIRED FOR USE WITH OPTIONAL ELECTRIC HEAT

●-Units with 15, 22.5, 30 or 45 kW electric heat require 6400 cfm (3020 L/s) minimum air.
●-Units with 60 or 90 kW electric heat require 7000 cfm (3305 L/s) minimum air.

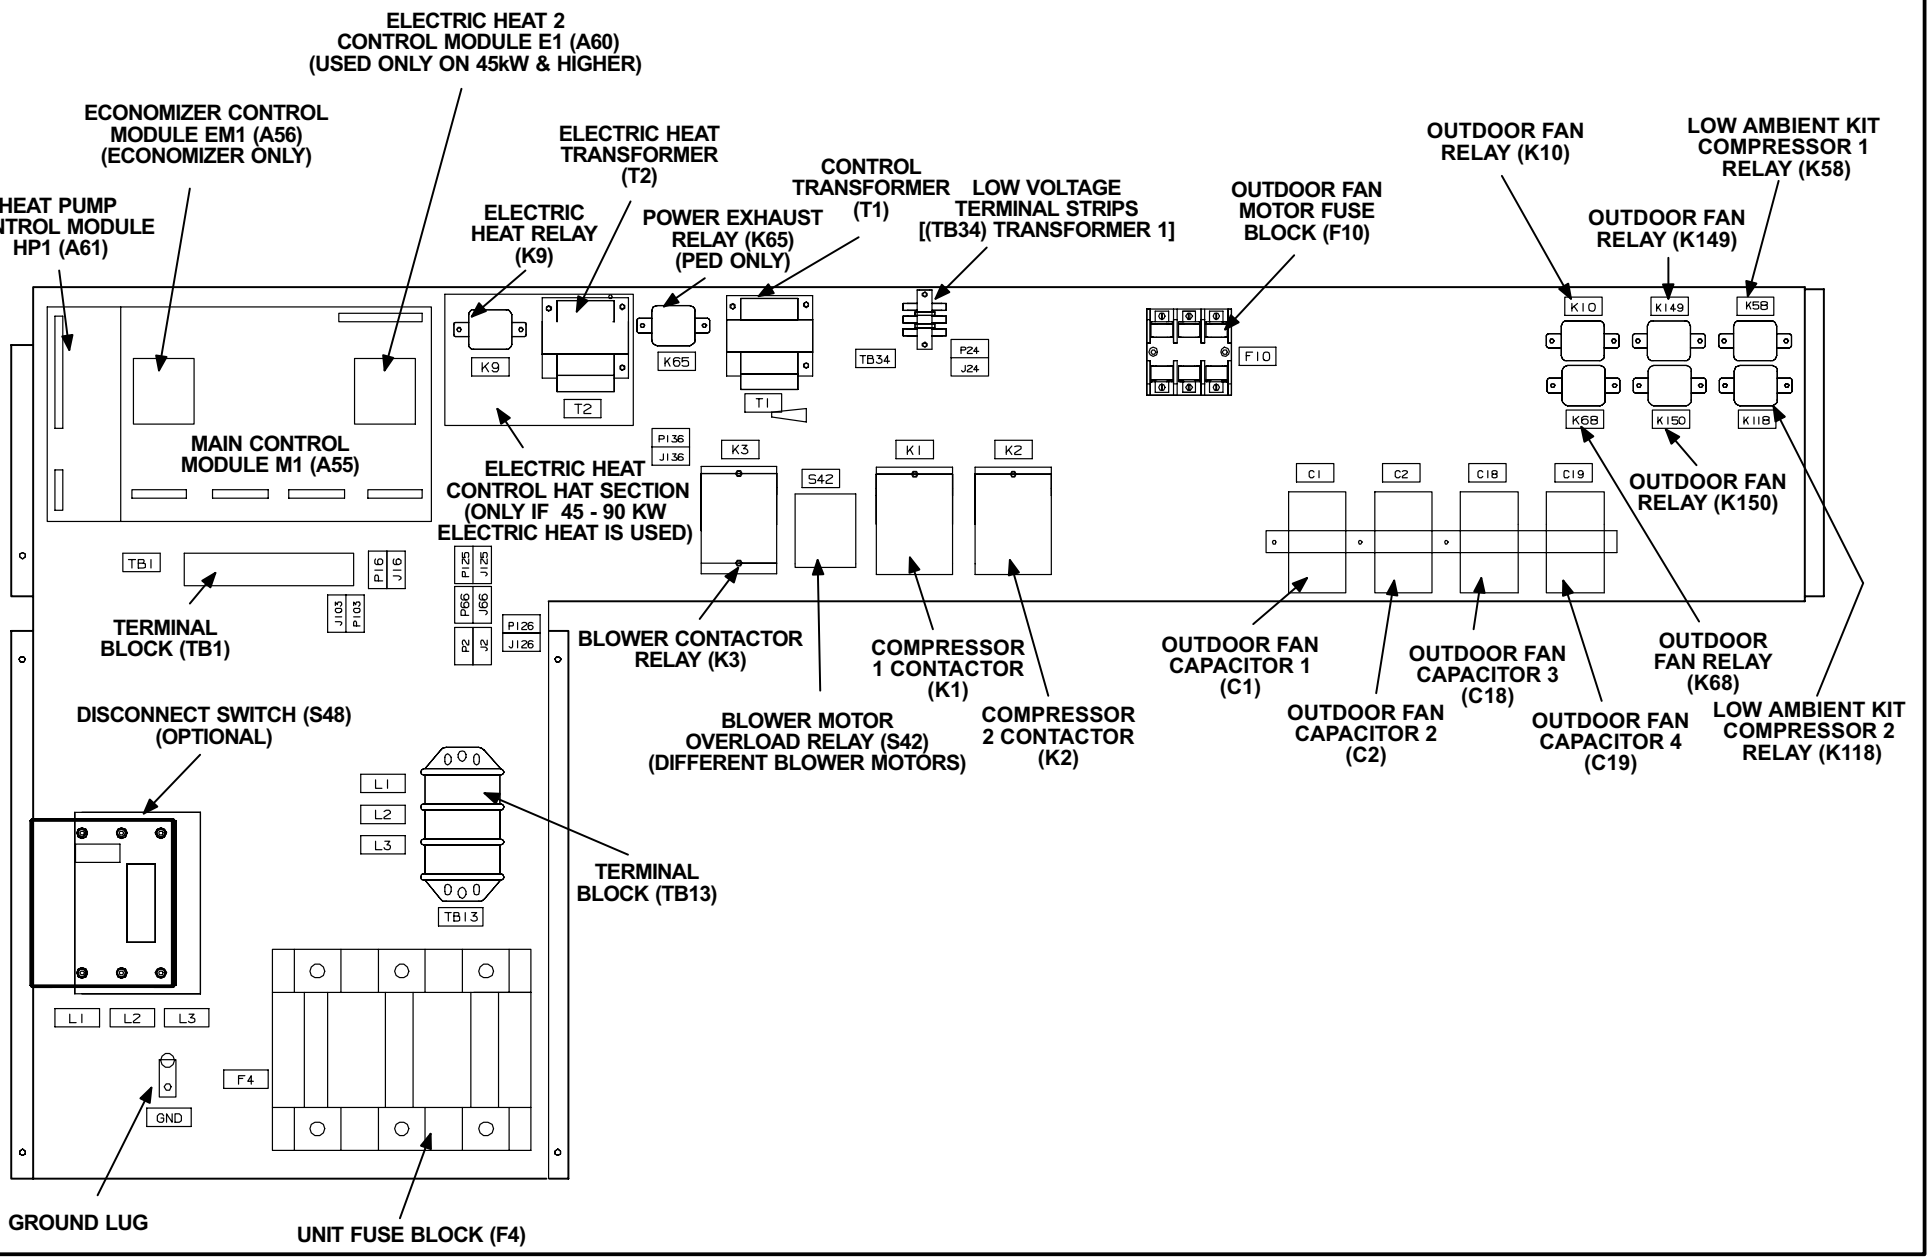

FIGURE 6

I-UNIT COMPONENTS

LGA / LCA / LHA13, 15, 17.5, 20 and 25 ton (46, 53, 62, 70, and 88 kW) units are configure to order units (CTO). The LGA and LCA unit components are shown in figures 1 and 2. For LHA 15 and 20 ton (52.8 and 70.3 kW) series unit components see figure 3. All units come standard with hinged unit panels. The unit panels may be held open with the door rod located inside the unit. All L1, L2, and L3 wiring is color coded; L1 is red, L2 is yellow, and L3 is blue.

A-Control Box Components

ELECTROSTATIC DISCHARGE (ESD)
Precautions and Procedures

⚠CAUTION

Electrostatic discharge can affect electronic components. Take precautions during furnace installation and service to protect the furnace's electronic controls. Precautions will help to avoid control exposure to electrostatic discharge by putting the furnace, the control and the technician at the same electrostatic potential. Neutralize electrostatic charge by touching hand and all tools on an unpainted unit surface, such as the gas valve or blower deck, before performing any service procedure.

LGA control box components are shown in figure 4, while LCA control box components are shown in figure 5. LHA control box components are shown in figure 6. The control box is located in the upper left portion of the compressor compartment.

1-Disconnect Switch S48 (Optional all units)

All LGA/LCA/LHA units may be equipped with an optional disconnect switch S48. Other factory or field installed optional circuit breakers may be used, such as CB10. S48 and CB10 are toggle switches, which can be used by the service technician to disconnect power to the unit.

2-Control Transformer T1 (all units)

All LGA/LCA/LHA series units use a single line voltage to 24VAC transformer mounted in the control box. Transformer supplies power to control circuits in the unit. The transformer is rated at 70VA and is protected by a 3.5 amp circuit breaker (CB8). The 208/230 (Y) voltage transformers use two primary voltage taps as shown in figure 7, while 460 (G) and 575 (J) voltage transformers use a single primary voltage tap.

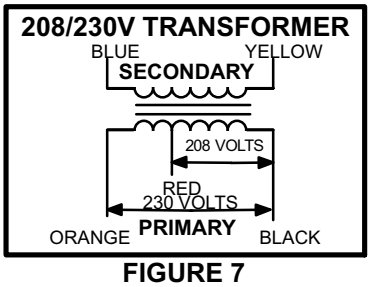

FIGURE 7

3-Contactor Transformer T18 (LGA / LCA units)

T18 is a single line voltage to 24VAC transformer used in all LGA/LCA series units. Transformer T18 is protected by a 3.5 amp circuit breaker (CB18). T18 is identical to transformer T1. The transformer supplies 24VAC power to the contactors.

4-C. A. B. Transformers T3 & T13 (LGA 460V & 575V units)

All LGA 460 (G) and 575 (J) voltage units use two auto voltage to 230VAC transformers mounted in the control box. The transformers have an output rating of 0.5A. T3 transformer supplies 230 VAC power to combustion air blower motor (B6), while T13 transformer supplies power to combustion air blower motor (B15).

5-Terminal Strips TB1, TB13, TB34 (all units), and TB35 (LGA / LCA units)

TB1 terminal strip distributes 24V power and common from the thermostat to the control box components. TB13 terminal strip distributes line voltage power to the line voltage items in the unit. TB34 terminal strip distributes 24V power from T1 to the control box components. TB35 terminal strip distributes 24V power from T18 to the contactors in the control box.

6-Outdoor Fan Motor Fuse Block & Fuses F10 (all units)

Three line voltage fuses F10 provide overcurrent protection to all condenser fans (and optional power exhaust fans) in all LGA / LCA and LHA units. The fuses are rated at 30A in 208/230V units and 15A in all others.

7-Unit Fuse Block & Fuses F4 (LHA & LCA units)

Three line voltage fuses F4 provide short circuit and ground fault protection to all cooling components in the LHA and LCA units. The fuses are rated in accordance with the amperage of the cooling components.

8-Outdoor Fan Capacitors C1, C2, C18, & C19 (all units)

Fan capacitors C1, C2, C18, C19 are 370V / 10 MFD capacitors used to assist in the start up of condenser fans B4, B5, B21, B22 respectively.

9-Compressor Contactor K1 & K2 (all units), K14 (LGA/LCA units), and K146 (LGA/LCA 210, 240 & 300S units)

All compressor contactors are three-pole-double-break contactors with a 24VAC coil. In all LHA units K1 (energized by A55) and K2 (energized by A61) energize compressors B1 and B2 respectively, in response to thermostat demand. In all LGA/LCA156H/180 units K1 (energized by A55), K2 (energized by A57), and K14 (energized by A59) energize compressors B1, B2, and B13 respectively in response

to first or second stage cooling demands. In all LGA/LCA210/240/300S units K1 (energized by A55), K2 (energized by A57), K14 and K146 (energized by A59) energize compressors B1, B2, B13, and B20 respectively.

10-Blower Contactor K3 (all units)

Blower contactor K3, used in all units, is a three-pole-double-break contactor with a 24VAC coil used to energize the indoor blower motor B3 in response to blower demand. K3 is energized by main control panel (A55).

11-Outdoor Fan Relay K10, K68, K149, & K150 (all units)

Outdoor fan relays K10, K68, K149, and K150, used in all units, are DPDT relays with a 24VAC coil. In all LHA units K10 (energized by A55), K68, K149, and K150 (energized by A61) energize condenser fans B4 (fan 1), B5 (fan 2), B21 (fan 3), and B22 (fan 4) respectively, in response to thermostat demand. In the LGA/LCA units, the outdoor fan relays work the same; however, K10 is energized by A55, K68 is energized by A57, and K149 and K150 are energized by A59.

12-Combustion Air Blower Relay K13 (LGA units - first burner section)

Combustion air blower relay K13, used in all LGA units, is a DPDT relay with a 24VAC coil. K13 is energized by the main control module A55 after a first stage heating demand from the thermostat. K13 remains energized throughout the heating demand. When energized, K13 N.O. contacts close to energize combustion air blower and begin a heating sequence. Pressure switch S18, located in the compressor compartment, closes as combustion air static pressure falls to “prove” combustion air blower operation. When S18 closes, the ignition controls and gas valves are energized to begin a heating sequence.

13-Combustion Air Blower Relay K19 (LGA units - second burner section)

Combustion air blower relay K19, used in all LGA units, is a DPDT relay with a 24 VAC coil. K19 is energized by the gas valve control module A58 after a first stage heating demand from the thermostat. K19 remains energized throughout the first stage heating demand. When energized, K19 N.O. contacts close to energize the second heat section combustion air blower and begin second section heating sequence. Pressure switch S45, located in the compressor compartment, closes as combustion air static pressure falls to “prove” combustion air blower operation. When S45 closes, the second section of the ignition control and gas valve are energized to begin the second section heating sequence.

14-Low Ambient Switch Relay K159 (LGA/LCA180 units)

Low ambient switch relay K159, used in all LGA/LCA156H/180 units, is a DPDT relay with a 24VAC coil. When one of the N.O. low pressure low ambient switches S11, S84, or S85 close (due to a pressure rise), K159 is energized. When K159-1 closes, A55 energizes K10 which in turn energizes outdoor fan motor B4. When K159-2 closes, A59 energizes K149 which in turn energizes outdoor fan motor B21. When the pressure lowers due to the outdoor fan motors cycling on, the pressure switch(es) will open and K159 will be de-energized.

15-Low Ambient Bypass Fan (Kit) Relays K58 & K118 (LHA units)

Low ambient bypass relays K58 and K118, used in all LHA units, are N.C. DPDT relays with a 24VAC coil. K58 is wired in parallel with the first compressor reversing valve (L1) and is energized by A55. K118 is wired in parallel with the second compressor reversing valve (L2) and is energized by A61. When L1 is energized in the cooling cycle, K58 is also energized, opening K58-1. When L2 is energized in the cooling cycle, K118 is also energized, opening K118-1. Therefore, K58-1 and K118-1 are always closed during heating demand bypassing S11 and S84. This allows all fans to operate during heating demand and to cycle during cooling demand.

16-Burner Controls A3 & A12 (LGA units)

All LGA units have two burner controls. A3 controls gas heat section one, while A12 controls gas heat section two. The first gas heat section and the second gas heat section burner controls are identical. Both burner controls are factory set and are not adjustable. The control makes three attempts at ignition and then locks out the system if ignition is not obtained after the third trial. Reset after lockout requires only breaking and remaking thermostat demand. The control shuts off gas flow immediately in the event of a gas or power failure. Upon restoration of gas and power, the control will restart the ignition sequence and continue until flame is established or system locks out. For a more detailed description see the Gas Heat Components section.

17-Power Exhaust Relay K65 (PED units)

Power exhaust relay K65 is a N.O. DPDT relay with a 24VAC coil. K65 is used in all LGA/LCA/LHA units equipped with the optional power exhaust dampers. K65 is energized by the economizer control panel (A56), after the economizer dampers reach 50% open (adjustable in ECTO). When K65 closes, the exhaust fans B10 and B11 are energized.

18-Blower Motor Overload Relay S42 (units with high efficiency motors & standard efficiency motors of 7.5 HP and above)

The blower motor overload relay is used in all L series units equipped with high efficiency motors, as well as units with standard efficiency motors 7.5 HP and higher. The relay (S42) is connected in line with the blower motor to monitor the current flow to the motor. When the relay senses an overload condition, a set of normally closed contacts open to de-energize pin #9 in plug 110 of the A55 main control module. A55 de-energizes all outputs. Early model units have been equipped with a control manufactured by Telemecanique which is detailed in figure 8. Units built after November 21, 1997, are equipped with a relay manufactured by Siemens which is detailed in figure 9. 7.5 HP motors used in units built in late 1998, will have an internal overload relay.

ELECTRIC HEAT CONTROL HAT SECTION (45 - 90 kW electric heat only)

19-Electric Heat Relay K9

All LCA/LHA series units with 45 - 90 kW electric heat use an electric heat relay K9. K9 is a N.O. SPST pilot relay intended to electrically isolate the unit's 24V circuit from the electric heat 24V circuit. K9 is energized by the main control board A55. K9-1 closes, enabling T2 to energize the electric heat control panel A60 and contactors K17 and K18.

20-Electric Heat Transformer T2

All LCA/LHA series units with 45 - 90 kW electric heat use a single line voltage to 24VAC transformer mounted in the electric heat control hat section in the control box. The transformer supplies power to all electric heat controls (contactors and coils). The transformer is rated at 70VA and is protected by a 3.5 amp circuit breaker CB13. The 208/230 (Y) voltage transformers use two primary voltage taps as shown in figure 7. Transformer T2 is identical to T1.

INTEGRATED MODULAR CONTROL BOARDS

The Integrated Modular Control (IMC) is a series of control boards which integrates most control functions required for the LGA/LCA/LHA units. The control boards are located in the upper left hand corner of the control box. The control includes complete unit diagnostics with permanent code storage, field programmable control parameters and control options, on-site testing, and serial communications. Seven different printed circuit boards (see figure 10) make-up the modular configurations for the LGA/LCA/LHA units. See table 1 for a list of control panels used for each unit. For further information refer to Integrated Modular Control Guide sent with each unit.

TABLE 1

UNIT	CONTROL PANELS						
	A55	A57	A59	A58	A60	A61	A56
LGA	X	X	X	X			OPT
LCA	X	X	X		X		OPT
LHA	X				X	X	OPT

21-Main Control Module A55 (all units)

The main control module A55 is the heart of the system. It controls one compressor, one two-stage gas valve, one bank of electric heat, one outdoor fan, and one blower. A55 includes the thermostat inputs, serial communications ports, diagnostic code display, control pushbutton, system configuration dip switches, and four expansion ports. A diagnostic code list is located on the back side of the left access panel.

22-Compressor 2 Control Module A57 (LGA & LCA units)

The compressor 2 control module A57 controls one additional compressor stage for the LGA/LCA units. A57 includes all inputs and outputs required for compressor and fan control, compressor stages diagnostics, and low ambient control.

23-Compressor 3 & 4 Control Module A59 (LGA & LCA units)

The compressor 3 & 4 control module A59 controls two additional compressor stage for the LGA/LCA units. A59 includes all inputs and outputs required for compressor and fan control, compressor stage diagnostics, and low ambient control.

24-Gas Valve Control Module A58 (LGA units)

The gas valve control module A58 controls an additional burner with a two-stage gas valve. A58 includes all inputs and outputs required for control and diagnostics of one two-stage gas valve burner.

25-Electric Heat Control Module A60 (LCA & LHA units if 45 - 90 kW electric heat is used)

The electric heat control module A60 is used to control a second electric heat bank. A60 is used on the LHA and LCA units.

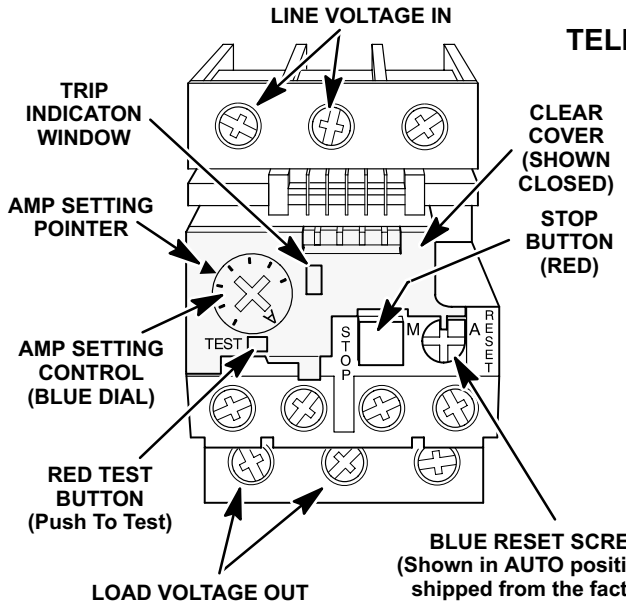
26-Heat Pump Control Module A61 (LHA units)

The heat pump control module A61 is used to control the second compressor stage on the LHA units. Like the A57 and A59 boards, the A61 board includes all inputs and outputs required for the compressor and fan control, compressor stage diagnostics and low ambient control.

27-Economizer Control Module A56 (Economizer only)

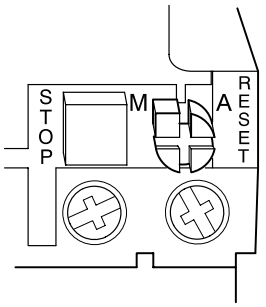
The economizer control module A56 controls the economizer. A56 has four different cooling modes, sensible temperature, outdoor enthalpy, differential enthalpy, and global control.

TELEMECANIQUE OVERLOAD RELAY



DETAIL SHOWING RESET BUTTON ADJUSTED TO MANUAL POSITION

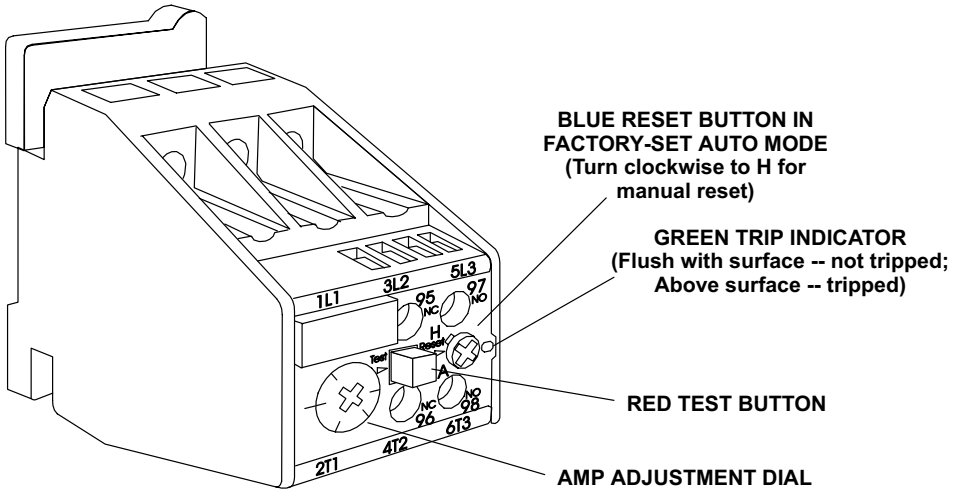
Lift clear cover and turn adjustment screw counterclockwise. Reset screw will pop out when pointer is in M (manual position). Close cover to lock reset screw into position.



Lift clear cover to adjust relay amp setting according to value given on the blower motor nameplate. Proper relay amp setting equals motor nameplate FLA X service factor of 1.15 X .95.
Cover must also be lifted to adjust control mode from automatic reset to manual reset (see detail above) and to test the control.
Control must be in the manual reset mode to perform a test. Use a pointed object to press the small red test button. A yellow marker should appear in the trip indication window to the right of the amp setting control. Press the blue reset screw to reset the relay.
The red STOP button opens the normally closed contacts which power the blower motor. This button stops blower motor operation as long as it is pressed in.

FIGURE 8

SIEMENS OVERLOAD RELAY



Adjust relay amp setting according to value given on the blower motor nameplate. Proper relay amp setting equals motor nameplate FLA X service factor of 1.15 X .95.
Use small slotted screwdriver to adjust control mode from automatic reset (A) to manual reset (H).
Control must be in the manual reset mode (H) to perform a test. Press the red test button. Green trip indicator should pop out. Press the blue reset screw to reset the relay.

B-Cooling Components

LGA/LCA/LHA units use independent cooling circuits consisting of separate compressors, condenser coils and evaporator coils. See figures 11, 12, and 13. Four draw-through type condenser fans are used in all units. All units are equipped with belt-drive blowers which draw air across the evaporator during unit operation.

Cooling may be supplemented by a factory- or field-installed economizer. The evaporators are slab type and are stacked. Each evaporator uses a thermostatic expansion valve as the primary expansion device. Each evaporator is also equipped with enhanced fins and rifled tubing. In all units each compressor is protected by a crankcase heater, high pressure switch and low pressure switch. Additional protection is provided by low ambient switches and freezestats (on each evaporator).

1-Compressors B1 and B2 (all units) B13 (all LGA/LCA/156H 180/210/240 units) B20 (all LGA/LCA 210/240/300S units)

Early model LGA/LCA standard efficiency and early model LHA high efficiency units use reciprocating type compressors. All LGA and LCA high efficiency units , late model LGA/LCA standard efficieny and late model LHA high efficiency units use scroll compressors. All LGA/LCA 13 ton (46 kW) units use three four ton (14.1 kW) compressors;15 ton (52.8 kW) units use three five-ton (10.6 kW) compressors; 17.5 ton (61.5 kW) units use four four-ton (14.1 kW) compressors; 20 ton (70.3 kW) units use four five-ton (17.6 kW) compressors and 25 ton (88 kW) units use four six ton (21 kW) compressors. All LHA 15 ton (52.8 kW) units use two 7.5-ton (26.4 kW) compressors and 20-ton (70.3 kW) units use two 10-ton (35.2 kW) compressors. All units are equipped with independent cooling circuits. Likewise, compressor capacity may vary from stage to stage. In all cases, the capacity of each compressor is added to reach the total capacity of the unit.

⚠ WARNING

Electrical shock hazard. Compressor must be grounded. Do not operate without protective cover over terminals. Disconnect power before removing protective cover. Discharge capacitors before servicing unit. Failure to follow these precautions could cause electrical shock resulting in injury or death.

Each compressor is energized by a corresponding compressor contactor.

NOTE-Refer to the wiring diagram section for specific unit operation.

2-Crankcase Heaters HR1 and HR2 (all units) HR5 (LGA/LCA 156H/180/210/240/300S) HR11 (LGA/LCA 210/240/300S)

Early model LGA/LCA standard efficieny units use insertion type heaters. All other modes use belly-band type crankcase heaters. HR1 is installed around compressor B1, heater HR2 compressor B2, HR5 compressor B13, and HR11 compressor B20. Crankcase heater wattage varies by compressor size.

⚠ IMPORTANT

Pressure switch settings on R410A charged units are significantly higher than units charged with R22.

3-High Pressure Switches S4 and S7 (all units) S28 (LGA/LCA 156H/180/210/240/300S) S96 (LGA/LCA 210/240/300S)

The high pressure switches is an auto-reset SPST N.C. switch which opens on a pressure rise. All LGA/LCA/LCC/LHA units are equipped with this switch. The switch is located in the compressor discharge line and is wired in series with the compressor contactor coil.

S4 (first circuit), S7 (second circuit), S28 (third circuit), and S96 (fourth circuit) are wired in series with the respective compressor contactor coils.

Units charged with R22

When discharge pressure rises to 450 ± 10 psig (3103± 69 kPa) (indicating a problem in the system) the switch opens and the compressor is de-energized (the economizer can continue to operate). When discharge pressure drops to 300 ± 20 psig (2068 ± 138 kPa) the pressure switch will close.

Units charged with R410A

Units charged with R410A refrigerant will have higher pressure switch settings. When discharge pressure rises to 640 ± 10 psig (4413± 69 kPa) (indicating a problem in the system) the switch opens and the compressor is de-energized (the economizer can continue to operate). When discharge pressure drops to 475 ± 20 psig (3275 ± 138 kPa) the pressure switch will close.

Main control A55 has a three-strike counter before locking out. This means the control will allow three high pressure trips per one thermostat demand. The control can be reset by breaking and remaking the thermostat demand or manually resetting the control.

4-Low Ambient Switches S11 & S84(all units) S85 (LGA/LCA 156H/180/210/240/300S) S94 (LGA/LCA 210/240/300S)

The low ambient switch is an auto-reset SPST N.O. pressure switch which allows for mechanical cooling operation at low outdoor temperatures. All LGA/LCA/LHA units are equipped with this switch. In all models a switch is located in each liquid line prior to the indoor coil section.

In the LGA/LCA156H/180 units S11 (compressor one), S84 (compressor two), and S85 (compressor three) are wired in parallel, wired to the low ambient switch relay K159. In the LGA/LCA 210/240/300S units S11 and S84 are in parallel, wired to outdoor fan relay K10, while S85 and S94 (compressor four) are in parallel, wired to third outdoor fan relay K149. In the LHA180/240 units S11 is wired in series with the first outdoor fan relay K10, while S84 is wired in series with the third outdoor fan relay K149.

Units charged with R22

When liquid pressure rises to 275 $\pm$ 10 psig (1896 $\pm$ 69 kPa), the switch closes and the condenser fan is energized. When discharge pressure in both refrigerant circuits drop to 150 $\pm$ 10 psig (1034 $\pm$ 69 kPa), the switch opens and the condenser fan is de-energized. This intermittent fan operation results in higher evaporating temperature allowing the system to operate without icing the evaporator coil and losing capacity.

Units charged R410A

Units charged with R410A refrigerant will have higher pressure switch settings. When liquid pressure rises to 450 $\pm$ 10 psig (3102 $\pm$ 69 kPa), the switch closes and the condenser fan is energized. When discharge pressure in both refrigerant circuits drop to 240 $\pm$ 10 psig (1655 $\pm$ 69 kPa), the switch opens and the condenser fan is de-energized. This intermittent fan operation results in higher evaporating temperature allowing the system to operate without icing the evaporator coil and losing capacity.

5-Low Pressure Switches S87 & S88(all units) S98 (all LGA/LCA 156H/180/210/240/300S) S97 (LGA/LCA 210/240/300S)

The low pressure switch is an auto-reset SPST N.O. switch (held N.C. by refrigerant pressure) which opens on a pressure drop. All LGA/LCA/LHA units are equipped with this switch.

S87 (compressor one), S88 (compressor two), S98 (compressor three), and S97 (compressor four) are located in the compressor suction line.

The main control module A55 governs the low pressure switches by shunting the switches during start up until pressure is stabilized. After the shunt period, the control has a three-strike counter, during first thermostat demand, before the compressor is locked out. The control is reset by breaking and remaking the thermostat demand or manually resetting the control.

Units charged with R22

When suction pressure drops to 25 $\pm$ 5 psig (172 $\pm$ 34 kPa) (indicating low pressure), the switch opens and the compressor is de-energized. The switch automatically resets when pressure in the suction line rises to 55 $\pm$ 5 psig (379 $\pm$ 34 kPa).

Units charged with R410A

Units charged with R410A refrigerant will have higher pressure switch settings. When suction pressure drops to 40 $\pm$ 5 psig (276 $\pm$ 34 kPa) (indicating low pressure), the switch opens and the compressor is de-energized. The switch automatically resets when pressure in the suction line rises to 90 $\pm$ 5 psig (620 $\pm$ 34 kPa)

6-Service Valve (optional on LGA/LCA units)

LGA/LCA units may be equipped with service valves located in the discharge and liquid lines. The service valves are manually operated valves used for service operation (not available for Humiditrol units).

7-Discharge Temperature Switches S5 & S8 LHA180/240 with scroll compressors

The discharge temperature switches are located on the units discharge line and wired in series with S4 and S7 high pressure switches. The switches provide overload protection for scroll compressors used on LHA18/240. The switches opens at 240°F (116°C) and close at 190°F (88°C).

8-Reversing Valves L1 and L2 (all LHA180/240 units)

Two refrigerant reversing valves, each with 24 volt solenoid coils, are used to reverse refrigerant flow during unit operation in all LHA units. The reversing valves are connected in the vapor lines of each refrigerant circuit. Reversing valve L1 is connected in the first refrigerant cycle and L2 is connected in the second refrigerant cycle. The reversing valve coils are energized during cooling demand and during defrost.

The reversing valves in all LHA units are wired independently. Reversing valve L1 is controlled by the main control module A55 in response to first stage cooling demand or by first stage defrost. Reversing valve L2 is controlled by the heat pump control module A61 in response to second stage cooling demand or by second stage defrost.

9-Defrost Components and Operation (all LHA180/240 units)

a-Defrost Pressure Switch S46 and S104

The defrost pressure switches (S46 and S104) are auto-reset SPST N.C. pressure switches which open on a pressure rise. All LHA units are equipped with these switches. The switches are located on the suction line during heating cycle (discharge line during cooling and defrost cycle).

S46 (refrigeration circuit one) is wired to the main control board. S104 (refrigeration circuit two) is wired to the heat pump control board.

When discharge pressure reaches 275 ± 10 psig (1096 ± 69 kPa) (indicating defrost is completed) the switch opens. The switch automatically resets when pressure in the suction line drops to 80 ± 10 psig (552 ± 69 kPa).

b-Defrost Thermostat Switches S6 and S9 (all LHA180/240 units)

Defrost thermostat switches S6 (refrigeration circuit one) and S9 (refrigeration circuit two) are S.P.S.T. N.O. contacts which close on a temperature fall (initiating defrost). The switches are located on each of the expansion valve distributor assemblies at the inlet to the outdoor coil. The switches monitor the outdoor coil suction temperature to determine when defrost is needed. When the outdoor coil suction temperature falls to 35°F ± 4°F (1.7°C ± 2.2°C) the switch closes (initiating defrost after minimum run time of 30, 60, or 90 minutes). When the temperature rises to 60°F ± 5°F (15.6°C ± 2.8°C) the switch opens.

DEFROST OPERATION

Defrost operation of each of the two refrigeration circuits are controlled independently with separete timers, thermostats (S6 and S9) and pressure switches (S46 and S104).

During heating operation when outdoor coil temperature drops to 35 ± 4 °, the defrost thermostat S6 or S9 closes initiating defrost.

When defrost begins, the reversing valve (L1 or L2) for the circuit in defrost mode is energized. Supplemental electric heat is then energized.

When L1 energizes, N.C. K58-1 contacts open de-energizing outdoor fan relay K10, followed by outdoor fan B4. When L2 energizes, N.C. K118-1 contacts open de-energizing outdoor fan relay K68, followed by outdoor fan B5.

Defrost of a circuit terminates when the pressure switch for the circuit (S46 or S104) opens or when 15 minutes elapse. Defrost does **not** terminate when thermosts demand ends.

10-Accumulator (early model LHA180/240 units)

Early model LHA units are equipped with an accumulator. The purpose of the accumulator is to trap and evaporate all liquid refrigerant and prevent liquid refrigerant from entering the compressor.

11-Filter Drier (all units)

LGA/LCA/LHA units have a filter drier located in the liquid line of each refrigerant circuit at the exit of each condenser coil (outdoor coil in LHA units). The drier removes contaminants and moisture from the system.

12-Freezestats S49 and S50 (all units) S53(LGA/LCA 156H/180/210/240/300S) S95(LGA/LCA 210/240/300S)

Each unit is equipped with a low temperature switch (freezestat) located on the return bend of each evaporator coil. S49 (first circuit), S50 (second circuit), S53 (third circuit), and S95 (fourth circuit) are located on the corresponding evaporator coils.

Each freezestat is wired to the main control module A55. Each freezestat is a SPST N.C. auto-reset switch which opens at 29°F ± 3°F (-1.7°C ± 1.7°C) on a temperature drop and closes at 58°F ± 4°F (14.4°C ± 2.2°C) on a temperature rise. To prevent coil icing, freezestats open during compressor operation to temporarily disable the respective compressor until the coil warms sufficiently to melt any accumulated frost. If the freezestats are tripping frequently due to coil icing, check the unit charge, airflow and filters before allowing unit back in operation. Make sure to eliminate conditions which might promote evaporator ice build-up.

13-Condenser Fans B4, B5, B21, and B22 (all units)

See table of contents for SPECIFICATIONS of condenser fans used in LGA/LCA/LHA units. All condenser fans used have single-phase motors. All units are equipped with four condenser fans. The complete fan assembly may be accessed for servicing and cleaning by removing the fan grill and turning the complete assembly until the motor brackets line up with the notches in the top panel. Lift the fan assembly out of the unit and disconnect the jack plug located on the motor.

C-Blower Compartment

The blower compartment in all LGA/LCA/LHA units is located between the evaporator coil and the compressor / control section on the opposite side of the condenser coil. The blower assembly is accessed by disconnecting the blower motor jack plug J98/P98 (and all other plugs) and removing the screws on either side of the sliding base. The base pulls out as shown in figure 14.

1-Blower Wheels (all units)

All 13 through 25 ton (46 through 88 kW) LGA/LCA/LHA units have two 15 in. x 15 in. (381 mm x 381 mm) blower wheels. Both wheels are driven by one motor.

2-Indoor Blower Motor B3 (all units)

All LGA/LCA/LHA units use three-phase single-speed blower motors. CFM adjustments are made by adjusting the motor pulley (sheave). Motors are equipped with sealed ball bearings. All motor specifications are listed in the tables on pages 3, 5, and 6. Units may be equipped with motors manufactured by various manufacturers, therefore electrical FLA and LRA specifications will vary. See unit rating plate for information specific to your unit.

OPERATION / ADJUSTMENT

Blower Operation

NOTE-The following is a generalized procedure and does not apply to all thermostat control systems.

1- Blower operation is dependent on the thermostat control system option that has been installed in the LGA/LCA/LHA units. Refer to operation sequence of the control system installed for detailed descriptions of blower operation.

2- Generally, blower operation is set at the thermostat fan switch. With the fan switch in "ON" position and the **OCP** input is **"ON"**, the blower operates continuously. With the fan switch in "AUTO" position, the blower cycles with demand.

3- In most cases, the blower and entire unit will be off when the system switch is in the "OFF" position. The only exception is immediately after a heating demand when the blower control keeps the blower on until all heat is extracted from the heat exchanger.

Determining Unit Air Volume

1- The following measurements must be made with a dry indoor coil. Run blower without cooling demand. Air filters must be in place when measurements are taken.

2- With all access panels in place, measure static pressure external to unit (from supply to return).

3- Measure the indoor blower wheel RPM.

4- Refer to blower table on page 10, use static pressure and RPM readings to determine unit air volume. Use blower tables on pages 11 and 12 when installing units with the optional accessories listed.

5- The RPM can be adjusted at the motor pulley. Loosen Allen screw and turn adjustable pulley clockwise to increase RPM. Turn counterclockwise to decrease RPM. See figure 14.

Blower Belt Adjustment

Proper pulley alignment and belt tension must be maintained for maximum belt life.

NOTE-Tension new belt after 24-48 hours of operation. This will allow belts to stretch and seat in grooves.

1- Loosen four screws securing blower motor to sliding base. See figure 14.

2- *To increase belt tension -*
Turn belt tension adjusting screw to the left, or counterclockwise, to tighten the belt. This increases the distance between the blower motor and the blower housing.
To loosen belt tension -
Turn the adjusting screw to the right, or clockwise to loosen belt tension.

3- Tighten four screws securing blower motor to sliding base once adjustments have been made.

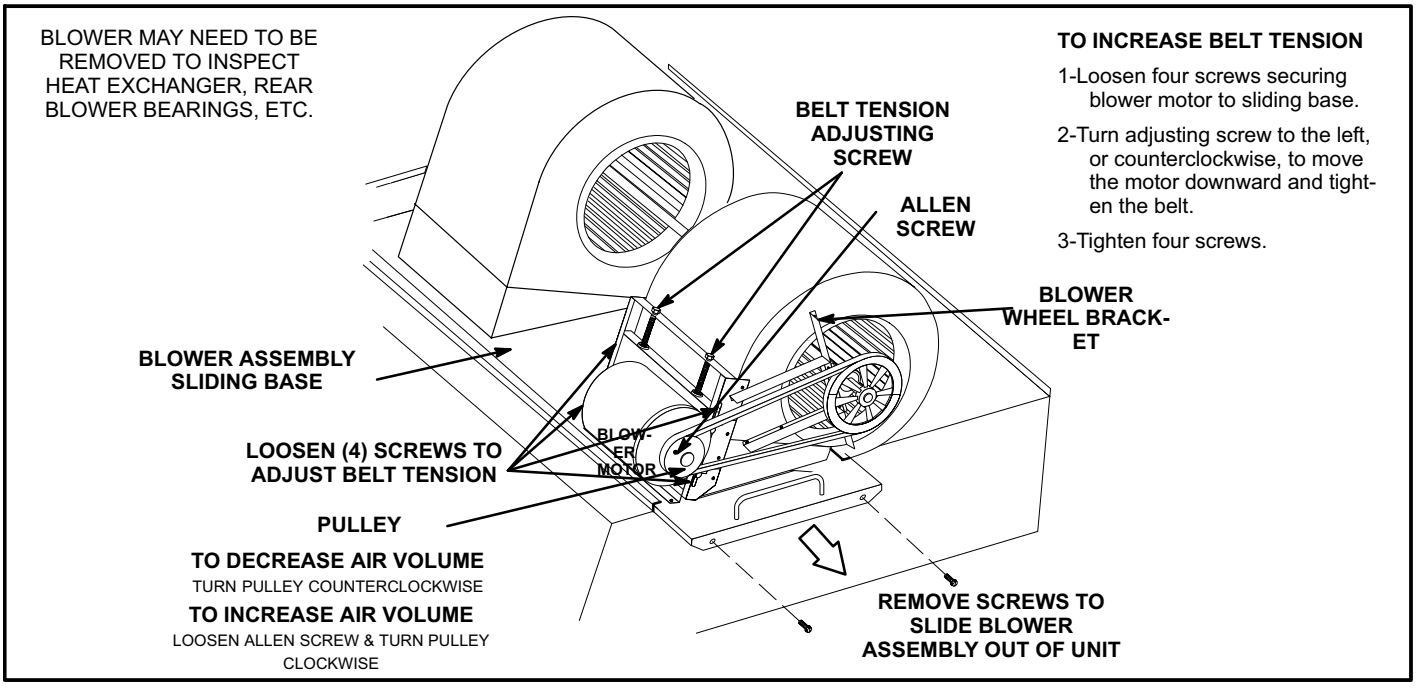

FIGURE 14

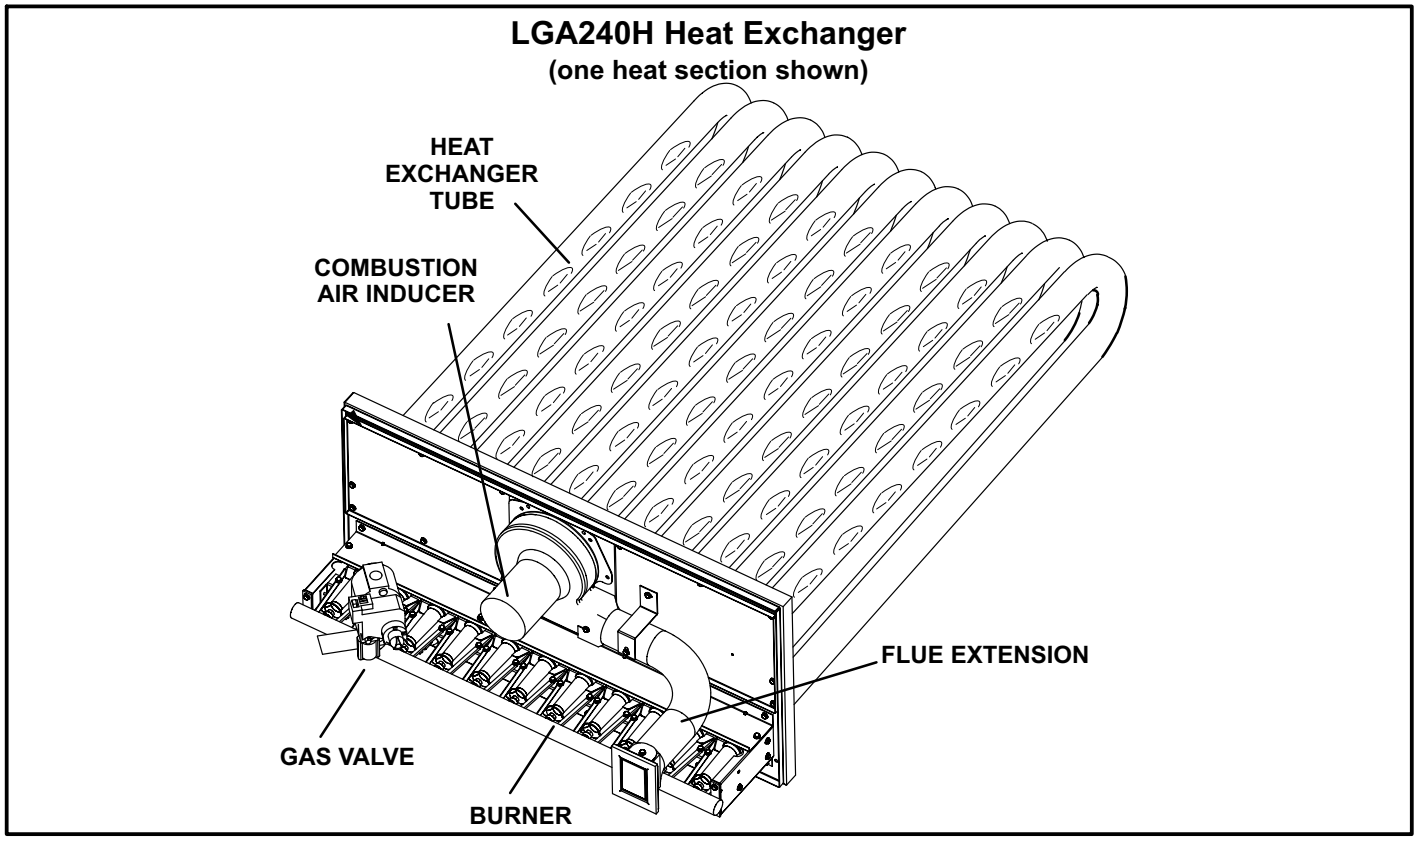

FIGURE 15

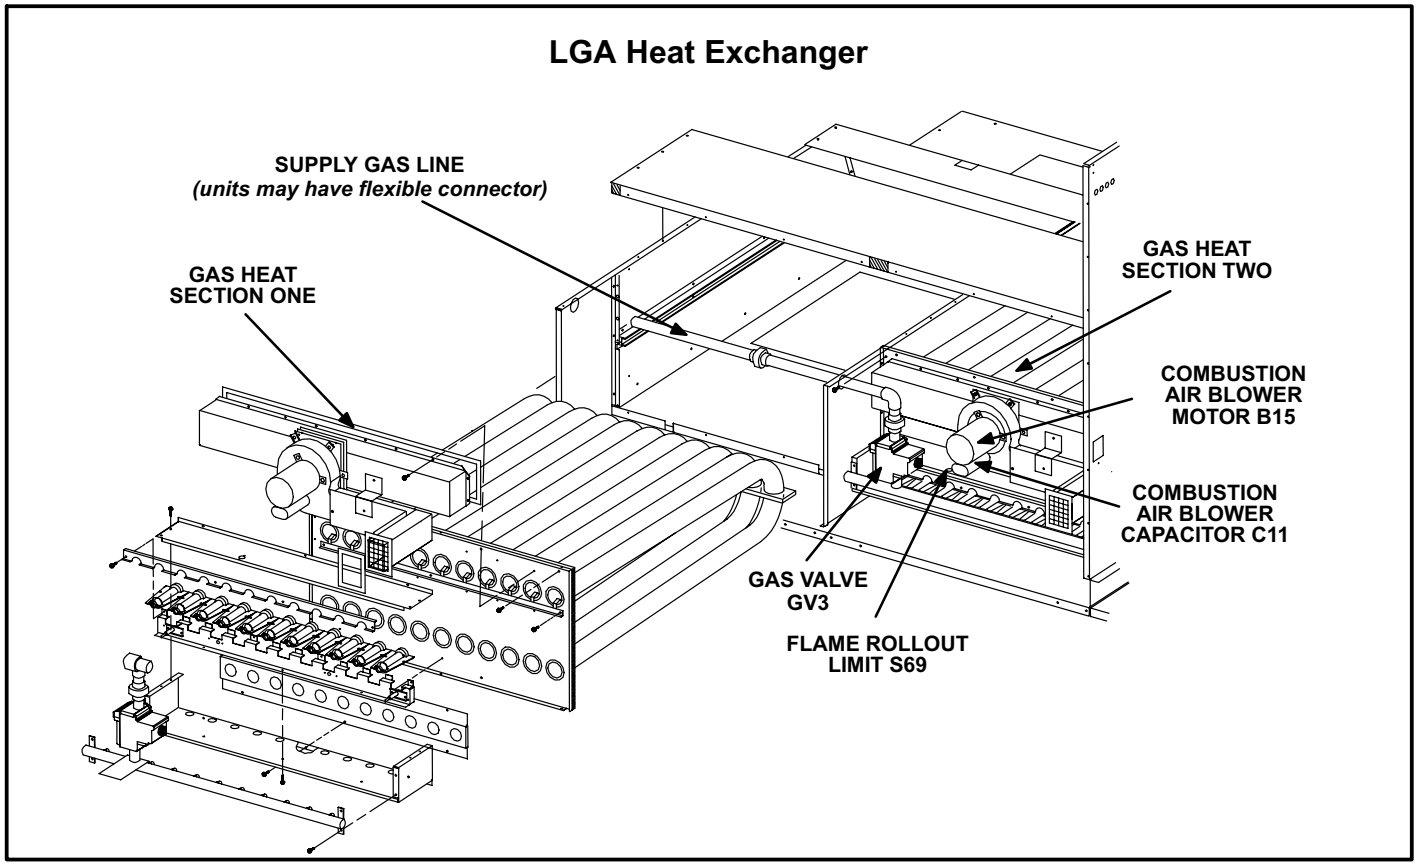

FIGURE 16

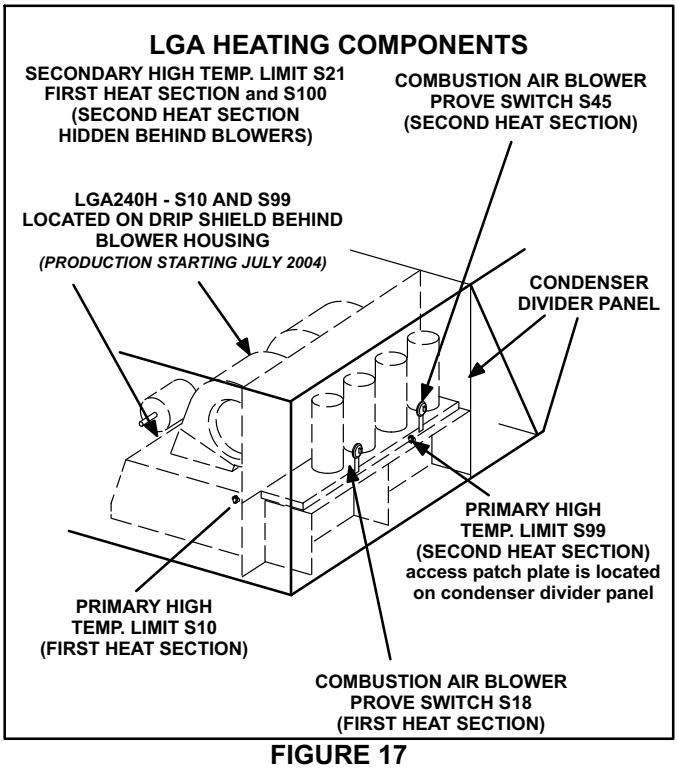

FIGURE 17

D-Gas Heat Components (all LGA units)

LGA156H units are available in 260,000 BTUH (76.2 kW) (standard gas heat only) and the LGA180/210/240/300S units are available in 260,000 BTUH (76.2 kW) (standard gas heat), or 470,000 BTUH (137.7 kW) (high gas heat) sizes. The LGA240H model is also available in 360,000 BTUH (105.5 kW) (medium gas heat) All units are equipped with two identical gas heat sections (gas heat section one and gas heat section two). Black steel pipe will feed supply gas to both sections. Late model units will have a flexible connection instead of cast iron pipe. If for service the flexible connection must broken, hand tighten, then using a wrench turn additional 1/4 turn for metal to metal seal *(do not over tighten).*

NOTE-Do not use thread sealing compound on flex pipe flare connections.

1-Control Box Components A3, A12, A55, A58, T3, T13, K13 and K19

⚠ WARNING

DISCONNECT POWER BEFORE SERVICING. CONTROLS ARE NOT FIELD REPAIRABLE. UNSAFE OPERATION WILL RESULT. IF CONTROLS ARE INOPERABLE, SIMPLY REPLACE THE ENTIRE CONTROL.

The main control box (see figure 4) houses the burner controls A3 and A12, main control module A55, gas valve (burner) control module A58, combustion air blower transformers T3 and T13, combustion air blower relay K13, and second heat section relay K19.

Burner Ignition Control A3 and A12

The ignition controls are located in the control box. Three different manufacturers' (Fenwal, Johnson Controls, and RAM) controls are used in the LGA units. All three ignition controls operate the same.

The ignition control provides three main functions: gas valve control, ignition, and flame sensing. The unit will usually ignite on the first attempt; however, the ignition attempt sequence provides three trials for ignition before locking out. The lockout time for the Johnson control is 5 minutes. The lockout time for the Fenwal control and RAM control is 1 hour. After lockout, the ignition control automatically resets and provides three more attempts at ignition. Manual reset after lockout requires breaking and remaking power to the ignition control. See figure 19 for a normal ignition sequence and figure 20 for the ignition attempt sequence with retrials (nominal timings given for simplicity). Specific timings for the ignition controls are shown in figure 21.

TABLE 2

Manufacturer	LED Code	Description
RAM	Steady "ON"	Normal
	2 Flash	Reset Mode
	Steady Flash	Failure
Johnson	Steady "ON"	Normal
	.5 sec on / 2.5 sec off	Reset Mode
	"OFF"	No Power or Detected Failure

Flame rectification sensing is used on all LGA units. Loss of flame during a heating cycle is indicated by an absence of flame signal (0 microamps). If this happens, the control will immediately restart the ignition sequence and then lock out if ignition is not gained after the third trial. See Sytems Service Checks section for flame current measurement.

The control shuts off gas flow immediately in the event of a power failure. Upon restoration of gas and power, the control will restart the ignition sequence and continue until flame is established or system locks out.

On a heating demand, the ignition control is energized by the main control module A55. The ignition control then allows 30 to 40 seconds for the combustion air blower to vent exhaust gases from the burners. When the combustion air blower is purging the exhaust gases, the combustion air prove switch is closing proving that the combustion air blower is operating before allowing the ignition control to energize. When the combustion air prove switch is closed and the delay is over, the ignition control activates gas valve, the spark electrode and the flame sensing electrode. Sparking stops immediately after flame is sensed. The combustion air blower continues to operate throughout the heating demand. If the flame fails or if the burners do not ignite, the ignition control will attempt to ignite the burners up to two more times. If ignition cannot be obtained after the third attempt, the control will lock out. The ignition control is not adjustable.

The RAM control is illustrated in figure 18. The four spade connections are used to connect the control to unit. Each of the four spade terminals are identified by function. The spark electrode wire connects to the spark-plug-type connector on top of the control.

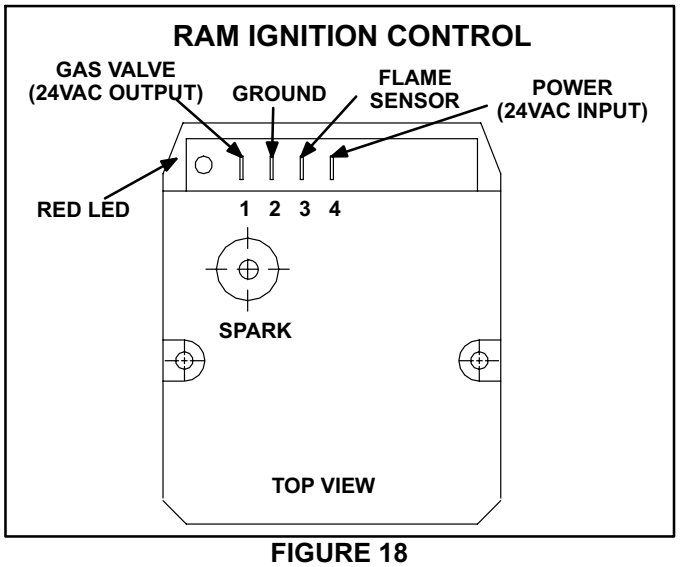

FIGURE 18

2-Heat Exchanger (Figures 15 and 16)

The LGA units use aluminized steel in shot burners with matching tubular aluminized (stainless steel is an option) steel heat exchangers and two-stage redundant gas valves. LGA uses two eleven tube/burners for high heat and two six tube/burners for low heat. The LGA240H uses two nine tube/burners for medium heat. Each burner uses a burner venturi to mix gas and air for proper combustion. Combustion takes place at each tube entrance. As hot combustion gases are drawn upward through each tube by the combustion air inducer, exhaust gases are drawn out the top and fresh air/gas mixture is drawn in at the bottom. Heat is transferred to the air stream from all surfaces of the heat exchanger tubes. The supply air blowers, controlled by the main control panel A55, force air across all surfaces of the tubes to extract the heat of combustion. The shape of the tubes ensures maximum heat exchange.

The gas valves accomplish staging by allowing more or less gas to the burners as called for by heating demand.

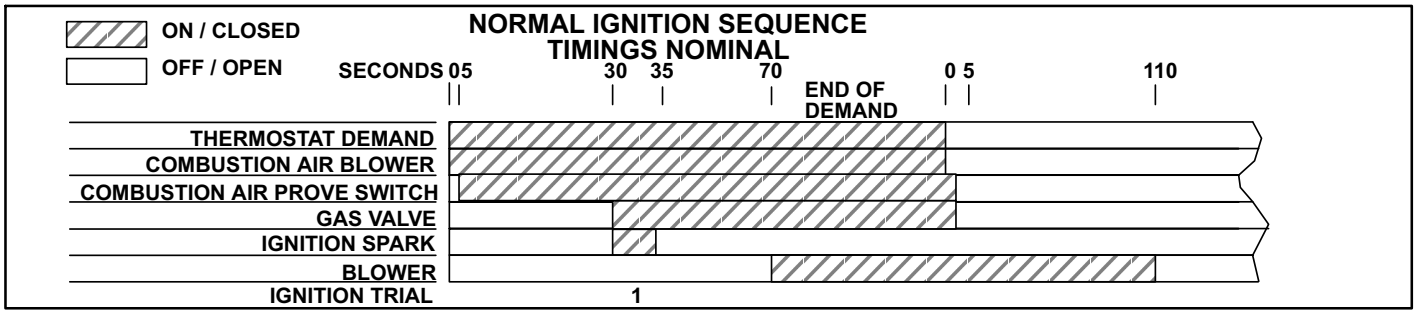

FIGURE 19

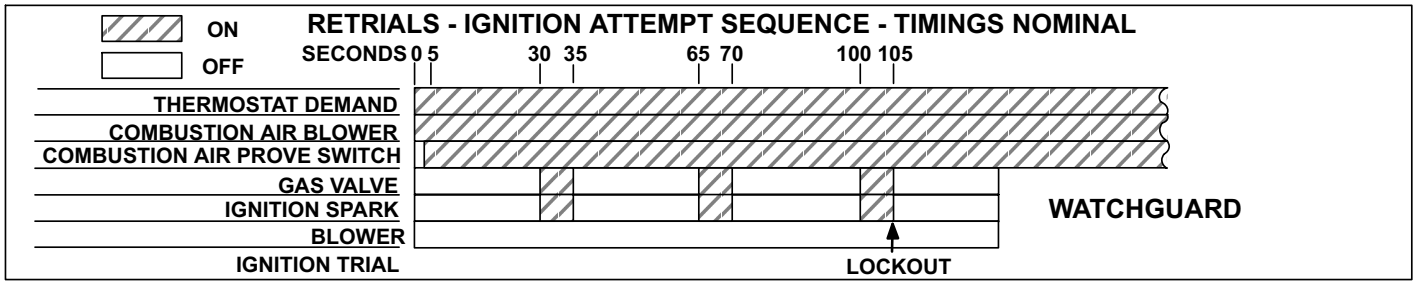

FIGURE 20

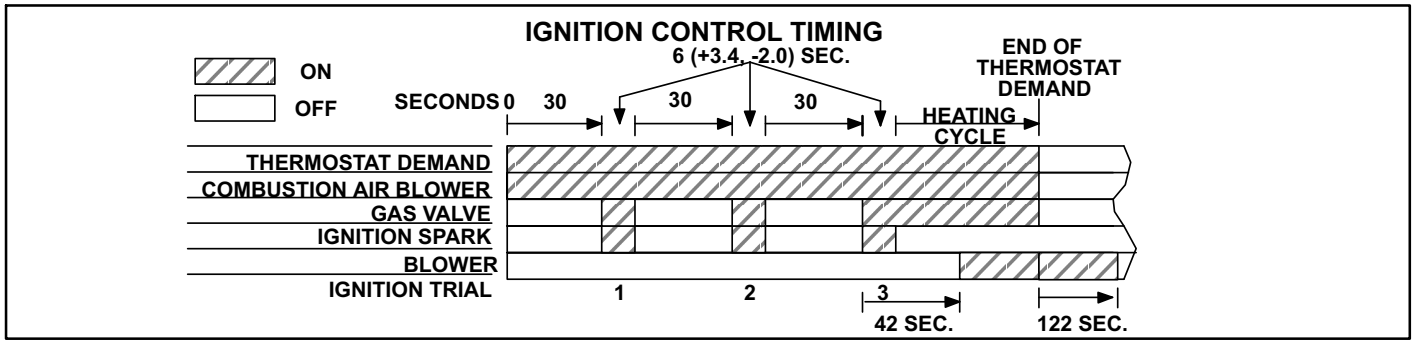

FIGURE 21

3-Burner Assembly (Figure 22)

The burners are controlled by the spark electrode, flame sensing electrode, gas valve and combustion air inducer. The spark electrode, flame sensing electrode and gas valve are directly controlled by ignition control. Ignition control and combustion air inducer is controlled by main control panel A55.

Burners

All units use inshot burners (see figures 22 and 23). Burners are factory set and do not require adjustment. A peep hole with cover is furnished in the heating access panel for flame viewing. Always operate the unit with the access panel in place.

Burners can be removed individually for service. Burner maintenance and service is detailed in the SERVICE CHECKS sections of this manual.

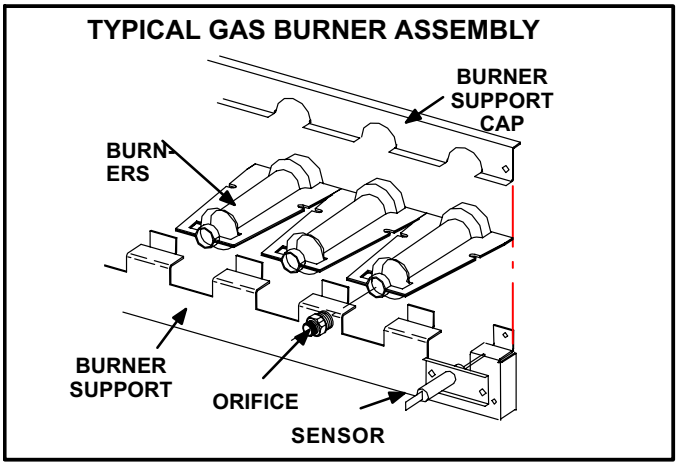

FIGURE 22

Orifice

Each burner uses an orifice which is precisely matched to the burner input. The orifice is threaded into the burner manifold. The burner is supported by the orifice and will easily slide off for service.

NOTE-Do not use thread sealing compound on the orifices. Using thread sealing compound may plug the orifices.

Each orifice and burner are sized specifically to the unit. Refer to Lennox Repair Parts Listing for correct sizing information.

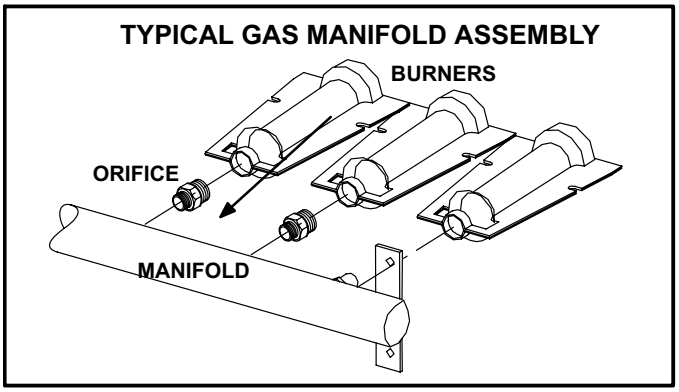

FIGURE 23

NOTE-In primary and secondary high temperature limits S10, S99, S21, and S100 the ignition circuits in both gas heat sections one and two are immediately de-energized when terminals 1-3 open and the indoor blower motor is immediately energized when terminals 1-2 close. This is the primary and secondary safety shutdown function of the unit.

4-Primary High Temperature Limits S10 & S99

S10 is the primary high temperature limit for gas heat section one, while S99 is the primary high temperature limit for gas heat section two. S10 is located in the blower compartment and is mounted on the end of the blower support panel which divides the blower compartment from the heating compartment (see figure 17). S99 is located on the blower support panel which separates the second gas heat section from the outdoor condenser section (see figure 17).

Figure 17 also shows the location of S10 and S99 in LGA240H units. S10 and S99 are located on the drip shield behind the blower housing. In this location S10 and S99 serve as both primary and secondary limt.

Primary limit S10 is wired to the main control panel A55 which energizes burner 1 control (A3), while primary limit S99 is wired to the gas 2 panel A58 which energizes burner 2 control (A12). Its N.C. contacts open to de-energize the ignition control when excessive temperature is reached in the blower compartment. At the same time, the N.O. contacts of S10 and S99 close energizing the blower relay coil K3 through control A55. If either limit trips the blower will be energized.

Limit set points are factory set and cannot be adjusted. If limit must be replaced same type and set point must be used. See Lennox Repair Parts Handbook .

5-Secondary High Temperature Limits S21 & S100

S21 is the secondary high temperature limit for heat section one, while S100 is the secondary high temperature limit for heat section two. Like the primary limits, the secondary limits are located in the blower compartment. S21 and S100 are mounted on top of the blowers (see figure 17).

Secondary limit S21 is also wired to the main control panel A55, while secondary limit S100 is wired to the gas 2 panel A58. The secondary limits function in the same manner as the primary limits, but are factory set to actuate at different temperatures. The N.O. contacts of both S21 and S100 are connected to the blower relay coil K3 through control A55. If either limit trips the blower will be energized. All limits used are SPDT N.C. auto-reset limits.

Limit set points are factory set and cannot be adjusted. If limit must be replaced same type and set point must be used. See Lennox Repair Parts Handbook .

6-Flame Rollout Limits S47 and S69

Flame rollout limits S47 (first heat section) and S69 (second heat section) are SPST N.C. high temperature limits located just above the burner air intake opening in the burner enclosures (see figure 16). S47 is wired to the main control panel A55, while S69 is wired to the gas 2 panel A58. When S47 or S69 senses flame rollout (indicating a blockage in the combustion air passages), the corresponding flame rollout limit trips, and the ignition control immediately closes the gas valve.

Limit S47 and S69 in standard heat units are factory preset to open at 250°F ± 12°F (121.1°C ± 6.7°C) on a temperature rise, while on high heat units both limits open at 270°F ± 12°F (132.2°C ± 6.7°C) on a temperature rise. All flame rollout limits are manual reset.

7-Combustion Air Prove Switches S18 & S45

Prove switches S18 (first heat section) and S45 (second heat section) are located in the compressor compartment . Both are SPST N.O. switches and are identical and monitor combustion air inducer operation. Switch S18 is wired to the main control panel A55, while S45 is wired to the gas 2 panel A58. The switch will automatically close on a *negative* pressure 0.46" W.C. ± 0.05" W.C. (114.6 Pa ± 12.4 Pa). This pressure fall and switch actuation allows power to the ignition control (proves, by closing, that the combustion air blower is operating before allowing the ignition control to energize.) The switch will open at 0.31"W.C. ± 0.05" (77.2 Pa ± 12.4 Pa) on pressure rise (less negative). The combustion air prove switch is factory set and not adjustable.

8-Combustion Air Blowers B6 and B15

Combustion air blowers B6 (first heat section) and B15 (second heat section) are identical blowers which provide fresh air to the corresponding burners while clearing the combustion chamber of exhaust gases. The blowers begin operating immediately upon receiving a thermostat demand and are de-energized immediately when thermostat demand is satisfied.

Both combustion air blowers use a 208/230V single-phase PSC motor and a 4.81in. x 1.25in. (122mm x 32mm) blower wheel. All motors operate at 3200RPM and are equipped with auto-reset overload protection. Blowers are supplied by various manufacturers. Ratings may vary by manufacturer. Specific blower electrical ratings can be found on the unit rating plate.

All combustion air blower motors are sealed and cannot be oiled. The blower cannot be adjusted but can be disassembled for cleaning.

9-Combustion Air Motor Capacitors C3 & C11

The combustion air blower motors in all LGA units require run capacitors. Capacitor C3 is connected to combustion air blower B6 and C11 is connected to combustion air blower B15. Both capacitors are rated at 3 MFD and 370VAC.

10-Gas Valves GV1 and GV3

Gas valves GV1 and GV3 are identical. The gas valves are two-stage redundant valves. Units are equipped with valves manufactured by White-Rodgers or Honeywell. On both valves first stage (low fire) is quick opening (on and off in less than 3 seconds). On the White-Rodgers valve second stage is slow opening (on to high fire pressure in 40 seconds and off to low fire pressure in 30 seconds). On the Honeywell second stage is quick opening. On a call for first stage heat (low fire), the valve is energized by the ignition control simultaneously with the spark electrode. On a call for second stage heat (high fire), the second stage operator is energized directly from A55 (GV1) and A58 (GV3). The White-Rodgers valve is adjustable for high fire only. Low fire is not adjustable. The Honeywell valve is adjustable for both low fire and high fire. A manual shut-off knob is provided on the valve for shut-off. Manual shut-off knob immediately closes both stages without delay. Figure 24 shows gas valve components. Table 3 shows factory gas valve regulation for LGA series units. Optional factory installed gas valves for single stage heat only, are available for the LGA180H. Gas valves are wired without W2 eliminating two stage heat.

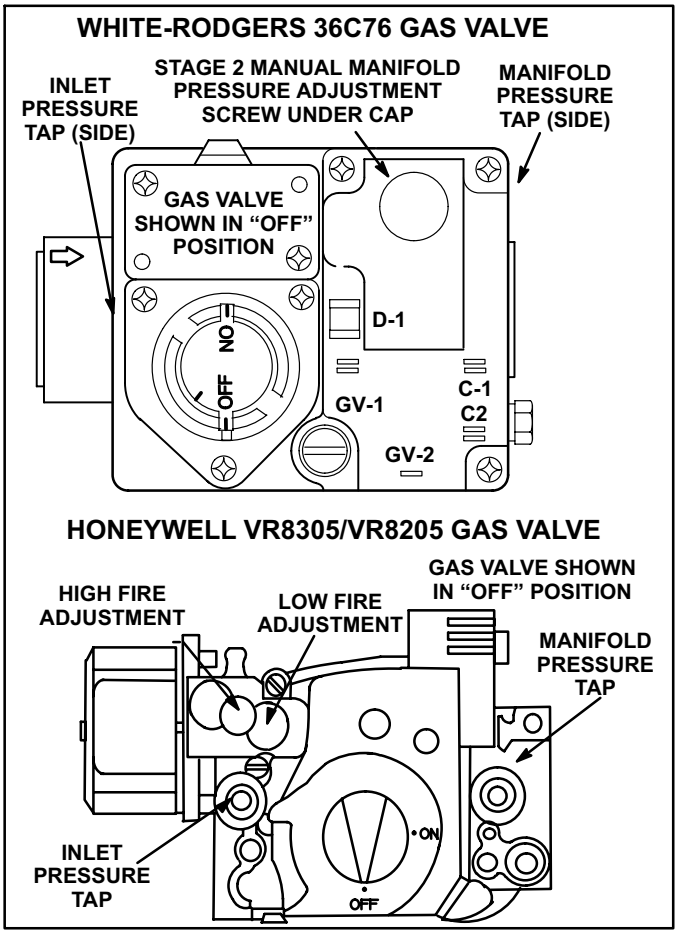

FIGURE 24

TABLE 3

GAS VALVE REGULATION FOR LGA UNITS				
Maximum Inlet Pressure	Operating Pressure (outlet) Factory Setting			
	Natural		L.P	
	Low	High	Low	High
13.0"W.C. 3232Pa	1.6±0.2"W.C. 398±50Pa	3.7±0.3"W.C. 920±75Pa	5.5±0.3"W.C. 1368±75Pa	10.5±0.5"W.C. 2611±7124Pa

11-Spark Electrodes

An electrode assembly is used for ignition spark. Two identical electrodes are used (one for each gas heat section). The electrode is mounted through holes on the left-most end of the burner support. The electrode tip protrudes into the flame envelope of the adjacent burner. The electrode assembly is fastened to burner supports and can be removed for service without removing any part of the burners.

During ignition, spark travels through the spark electrode (figure 25) and ignites the left burner. Flame travels from burner to burner until all are lit.

The spark electrode is connected to the ignition control by a 8 mm silicone-insulated stranded high voltage wire. The wire uses 1/4" (6.35 mm)female quick connect on the electrode end and female spark plug-type terminal on the ignition control end.

NOTE-IN ORDER TO MAXIMIZE SPARK ENERGY TO ELECTRODE, HIGH VOLTAGE WIRE SHOULD TOUCH UNIT CABINET AS LITTLE AS POSSIBLE.

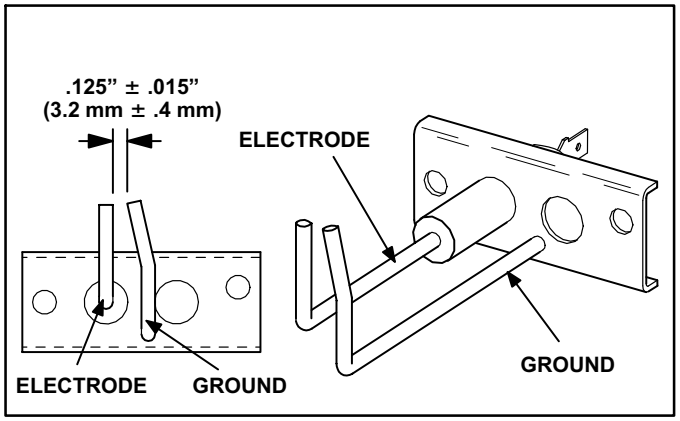

FIGURE 25

12-Flame Sensors

A flame sensor is located on the right side of each burner support. The sensor is mounted through a hole in the burner support and the tip protrudes into the flame envelope of the right most burner. The sensor assembly is fastened to burner supports and can be removed for service without removing any part of the burners.

When flame is sensed by the flame sensor (indicated by microamp signal through the flame) sparking stops immediately. During operation, flame is sensed by current passed along the ground electrode (located on the spark electrode), through the flame and into the sensing electrode. The ignition control allows the gas valve to stay open as long as a flame signal (current passed through the flame) is sensed.

†Refer to National or Canadian Electrical Code manual to determine wire, fuse and disconnect size requirements. Use wires suitable for at least 167°F (75°C).
[1]May be used with two stage control.
[2]Electric Heat Control Module required on 45, 60 & 90 kW sizes only (module furnished with factory installed electric heaters). See Optional Electric Heat Accessories tables.
[3]Factory installed circuit breaker not available.
NOTE — Fuse block must be ordered extra. Factory installed heaters will have the fuse block factory installed. Fuse block must be installed in field installed heaters. Also requires LTB2 Terminal Block. See Optional Electric Heat Accessories tables.

84 lbs. (38 kg) (total weight)	[4] 2	600	90.0	307,100						

NOTE - Fuse block must be ordered extra. Factory installed heaters will have the fuse block factory installed. Fuse block must be installed in field installed heaters. Also requires LTB2 Terminal Block. See Optional Electric Heat Accessories tables.

1 Electric Heat Control Module required on 45, 60 & 90 kW sizes only (module furnished with factory installed electric heaters). See Optional Electric Heat Accessories tables.

2 Refer to National or Canadian Electrical Code manual to determine wire, fuse and disconnect size requirements. Use wires suitable for at least 167°F (75°C).

3 HACR type breaker or fuse.

4 May be used with two stage control.

5 Factory installed circuit breaker not available.

†Refer to National or Canadian Electrical Code manual to determine wire, fuse and disconnect size requirements. Use wires suitable for at least 167°F (75°C).
[1]May be used with two stage control.
[2]Electric Heat Control Module required on 45, 60 & 90 kW sizes only (module furnished with factory installed electric heaters). See Optional Electric Heat Accessories tables.
[3]Factory installed circuit breaker not available.
NOTE — Fuse block must be ordered extra. Factory installed heaters will have the fuse block factory installed. Fuse block must be installed in field installed heaters. Also requires LTB2 Terminal Block. See Optional Electric Heat Accessories tables.

E-Optional Electric Heat Components

Tables 4 through 9 show all possible LCA/LHA to EHA match-ups and electrical ratings.

EHA parts arrangement is shown in figures 28 and 29. All electric heat sections consist of electric heating elements exposed directly to the airstream. Two electric heat sections (first section and second section) are used in all 15kW through 90kW heaters. See figure 27. Multiple-stage elements are sequenced on and off in response to thermostat demand.

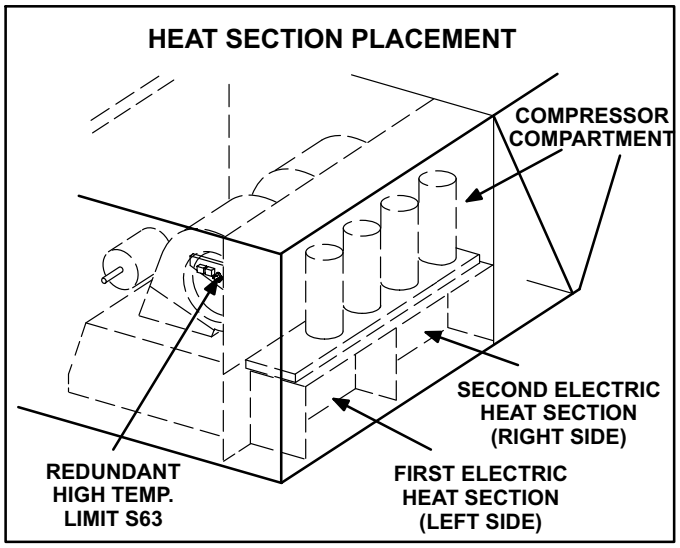

FIGURE 27

1-Main Control Box Components A55, A60, K9, T2, and F4

The main control box (see figure 4) houses a few of the electric heat controls, such as: the main control module A55, second electric heat section control panel A60, electric heat control hat section for 45 - 90 kW (electric heat relay K9 and transformer T2), and unit fuse block F4. For a description of the components see section I-A.

2-Contactors K15, K16, K17 and K18

Contactors K15, K16, K17 and K18 are all three-pole double-break contactors located on the electric heat vestibule. K15 and K16 are located on the first electric heat section, while K17 and K18 are located on the second electric heat section. However, in the 15 and 30kW heaters, the first section houses all contactors and fuses. All contactors are equipped with a 24VAC coil. The coils in the K15 and K16 contactors are energized by the main panel A55, while the coil in the K17 and K18 contactors are energized by the electric heat 2 control panel A60. Contactors K15 and K17 energize the first stage heating elements, while K16 and K18 energize the second stage heating elements.

3-High Temperature Limits S15 and S107 (Primary)

S15 and S107 are SPST N.C. auto-reset thermostats located on the back panel of the electric heat section below the heating elements. S15 is the high temperature limit for the first electric heat section, while S107 is the high temperature limit for the second electric heat section. Both thermostats are identical and are wired in series with the first stage contactor coil. When either S15 or S107 opens, indicating a problem in the system, contactor K15 is de-energized. When K15 is de-energized, first stage and all subsequent stages of heat are de-energized. The thermostats used on EHA360-45-1 Y/G/J are factory set to open at 200°F ± 5°F (93.3°C ± 2.8°C) on a temperature rise and automatically reset at 160°F ± 6°F (71.1°C ± 3.3°C) on a temperature fall. All other electric heat section thermostats are factory set to open at 170°F ± 5°F (76.7°C ± 2.8°C) on a temperature rise and automatically reset at 130°F ± 6°F (54.4°C ± 3.3°C) on a temperature fall. The thermostats are not adjustable.

4-High Temperature Limit S63 (Redundant)

S63 is a SPST N.C. manual-reset thermostat located on the suction line bracket inside the blower compartment (see figure 27). S63 is a redundant temperature limit factory installed in all LCA / LHA units. Like the primary temperature limits, S63 is wired in series with the first stage contactor coil (K15). When S63 opens, all contactors (K15, K16, K17, K18) are de-energized. When the contactors are de-energized, first stage and all subsequent stages of heat are de-energized. The thermostat is factory set to open at 170°F ± 8°F (76.7°C ± 4.4°C) on a temperature rise and can be manually reset when the temperature falls below 160°F ± 6°F (71.1°C ± 3.3°C).

5-Terminal Strip TB3

Electric heat line voltage connections are made to terminal strip TB3 (or a fuse block on some models) located in the upper left corner of the electric heat vestibule.

6-Heating Elements HE1 through HE14

Heating elements are composed of helix wound bare nichrome wire exposed directly to the airstream. Three elements are connected in a three-phase arrangement. The elements in 208/230V units are connected in a “Delta” arrangement. Elements in 460 and 575V units are connected in “Wye” arrangement. Each stage is energized independently by the corresponding contactors located on the electric heat vestibule panel. Once energized, heat transfer is instantaneous. High temperature protection is provided by primary and redundant high temperature limits and overcurrent protection is provided by fuses.

7-Fuse F3

Fuse F3 are housed in a fuse block which holds three fuses. Each F3 fuse is connected in series with each leg of electric heat. Figure 29 and table 10 show the fuses used with each electric heat section. For simplicity, the service manual labels the fuses F3 - 1 through F3 - 8.

II-PLACEMENT AND INSTALLATION

Make sure the unit is installed in accordance with the installation instructions and all applicable codes. See accessories section for conditions requiring use of the optional roof mounting frame (LARMF18/36 or LARMFH18/24).

III-CHARGING

⚠ WARNING

Refrigerant can be harmful if it is inhaled. Refrigerant must be used and recovered responsibly.

Failure to follow this warning may result in personal injury or death.

⚠ IMPORTANT

Units equipped with Humiditrol system MUST be charged in standard cooling mode.

A-Refrigerant Charge and Check

WARNING-Do not exceed nameplate charge under any condition.

This unit is factory charged and should require no further adjustment. If the system requires charge, *reclaim the charge, evacuate the system,* and *add required nameplate charge.*

NOTE - System charging is not recommended below 60°F (15°C). In temperatures below 60°F (15°C) , the charge ***must*** *be weighed into the system.*

If weighing facilities are not available, or to check the charge, use the following procedure:

1- Attach gauge manifolds and operate unit in cooling mode until system stabilizes (approximately five minutes). Make sure all outdoor air dampers are closed.

2- Check each system separately with all stages operating.

3- Use a thermometer to accurately measure the outdoor ambient temperature.

4- Apply the outdoor temperature to tables 11 through 19 (tables 20, 21, 22 and 23 are for humiditrol units) and throughto determine normal operating pressures.

5- Compare the normal operating pressures to the pressures obtained from the gauges. Minor variations in these pressures may be expected due to differences in installations. Significant differences could mean that the system is not properly charged or that a problem exists with some component in the system. **Correct any system problems before proceeding.**

6- If discharge pressure is high, remove refrigerant from the system. If discharge pressure is low, add refrigerant to the system.

- Add or remove charge in increments.
- Allow the system to stabilize each time refrigerant is added or removed.

7- Use the following approach method along with the normal operating pressures to confirm readings.

B-Charge Verification - Approach Method

8- Using the same thermometer, compare liquid temperature to outdoor ambient temperature.

Approach Temperature = Liquid temperature minus ambient temperature.

9- Approach temperature should match values in tables 24, 25 and 26. An approach temperature greater than value shown indicates an undercharge. An approach temperature less than value shown indicates an overcharge.

10-Do not use the approach method if system pressures do not match pressures in tables 11 through 19 (or tables 20, 21, 22 and 23 for Humidtrol units). The approach method is not valid for grossly over or undercharged systems.

TABLE 24
APPROACH TEMPERATURES

L Series Unit	Liquid Temp. Minus Ambient Temp.			
	1st Stage	2nd Stage	3rd Stage	4th Stage
156H	8°F ± 1 (4.4°C ± 0.5)	8°F ± 1 (4.4°C ± 0.5)	9°F ± 1 (5°C ± 0.5)	NA

LHA240	11° F ± 1 (6.1 ° C ± 0.5)	11° F ± 1 (6.1 ° C ± 0.5)

IV-STARTUP - OPERATION

Refer to startup directions and refer closely to the unit wiring diagram when servicing. See unit nameplate for minimum circuit ampacity and maximum fuse size.

A-Preliminary and Seasonal Checks

1- Make sure the unit is installed in accordance with the installation instructions and applicable codes.

2- Inspect all electrical wiring, both field and factory installed for loose connections. Tighten as required. Refer to unit diagram located on inside of unit control box cover.

3- Check to ensure that refrigerant lines are in good condition and do not rub against the cabinet or other refrigerant lines.

4- Check voltage at the disconnect switch. Voltage must be within the range listed on the nameplate. If not, consult the power company and have the voltage corrected before starting the unit.

5- Recheck voltage and amp draw with unit running. If voltage is not within range listed on unit nameplate, stop unit and consult power company. Refer to unit nameplate for maximum rated load amps.

6- Inspect and adjust blower belt (see section on Blower Compartment - Blower Belt Adjustment).

B-Cooling Startup

NOTE-The following is a generalized procedure and does not apply to all thermostat control systems. Electronic and ramping thermostat control systems may operate differently. Refer to the operation sequence section of this manual for more information.

⚠ WARNING

Crankcase heaters must be energized for 24 hours before attempting to start compressors. Set thermostat so there is no compressor demand before closing disconnect switch. Attempting to start compressors during the 24-hour warm-up period could result in damaged or failed compres-

1- Set fan switch to AUTO or ON and move the system selection switch to COOL. Adjust the thermostat to a setting far enough below room temperature to bring on all compressors. Compressors will start and cycle on demand from the thermostat (allowing for unit and thermostat time delays).

2- Each circuit is charged with R-22 refrigerant. See unit rating plate for correct charge amount.

3- Refer to Cooling System Service Checks and Charging sections for proper method of checking and charging the system.

C-Heating Startup

1 Set the fan switch to AUTO or ON and move the system selection switch to HEAT. Adjust thermostat setting above room temperature.

2 The indoor blower, first stage gas (LGA only), all compressors (LHA only), and first stage electric heat (LCA only) immediately start.

3 Additional stages are controlled by the indoor thermostat. An increased heating demand (W2) in the LHA units will bring on the electric heat if so equipped.

D-Safety or Emergency Shutdown

Turn off power to the unit.

V- SYSTEMS SERVICE CHECKS

A-LGA Heating System Service Checks

All LGA units are A.G.A and C.G.A. design certified without modification.

Before checking piping, check with gas company or authorities having jurisdiction for local code requirements. Refer to the LGA Installation, Operation and Maintenance instruction for more information.

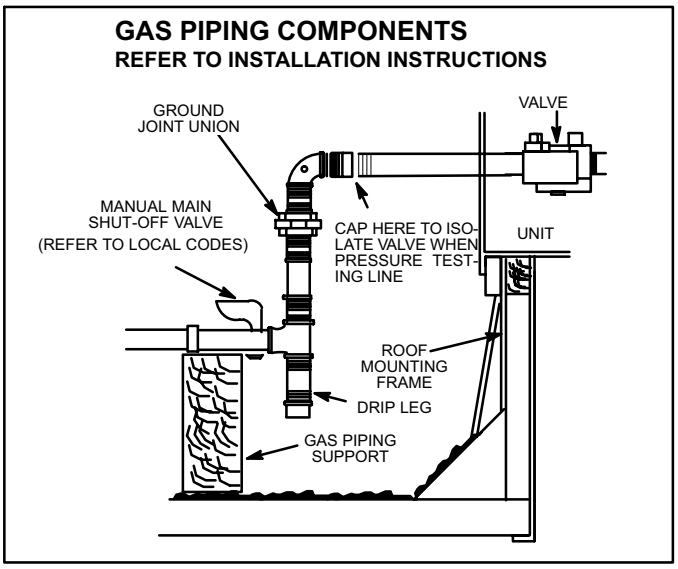

FIGURE 30

1-Gas Piping

Gas supply piping must not allow more than 0.5”W.C. (124.3 Pa) drop in pressure between the gas meter and the unit. Supply gas pipe must not be smaller than the unit gas connection. Refer to installation instructions for details.

2-Testing Gas Piping

NOTE-In case emergency shutdown is required, turn off the main manual shut-off valve and disconnect the main power to the unit. These controls should be properly labeled by the installer.

When pressure testing gas lines, the gas valve must be disconnected and isolated. Gas valves can be damaged if subjected to more than 0.5 psig [14”W.C. (3481 Pa)]. See figure 30.

When checking piping connection for gas leaks, use the preferred means. Common kitchen detergents can cause harmful corrosion on various metals used in gas piping. The use of specialty Gas Leak Detector is strongly recommended. It is available through Lennox under part number 31B2001. See CORP 8411-L10, for further details.

Do not use matches, candles, flame or any other source of ignition to check for gas leaks.

3-Testing Gas Supply Pressure

When testing gas supply pressure, connect test gauge to the inlet pressure tap on the gas valve. Test supply gas pressure with unit firing at maximum rate (both stages energized). Make sure the reading falls within the range of the following values. Low pressure may result in erratic operation or “underfire.” High pressure can result in permanent damage to the gas valve or “overfire.” For natural gas units, operating pressure at the unit gas connection must be between 4.7”W.C. and 10.5”W.C. (1168 Pa and 2610 Pa). For L.P. gas units, operating pressure at the unit gas connection must be between 10.8”W.C. and 13.5”W.C. (2685.3 Pa and 3356.7 Pa).

On multiple unit installations, each unit should be checked separately while operating at maximum rate, beginning with the one closest to the supply gas main and progressing to the one furthest from the main. Multiple units should also be tested with and without the other units operating. Supply pressure must fall within the range listed in the previous paragraph.

4-Check and Adjust Manifold Pressure

After line pressure has been checked and adjusted, check manifold pressure. Move test gauge to the outlet pressure tap located on unit gas valve GV1. See figure 24 for location of pressure tap on the gas valve.

The manifold pressure is factory set and should not require adjustment. If manifold pressure is incorrect and no other source of improper manifold pressure can be found, the valve must be replaced. See gas valve information in Gas Heat Component section and figure 24 for location of gas valve (manifold pressure) adjustment screw.

All gas valves are factory regulated. The gas valve should completely and immediately cycle off in the event of gas or power failure. The manual shut-off knob can be used to immediately shut off gas supply.

⚠ CAUTION

For safety, connect a shut-off valve between the manometer and the gas tap to permit shut off of gas pressure to the manometer.

Manifold Adjustment Procedure

1- Connect test gauge to the outlet pressure tap on the gas valve. Start the unit (call for second stage heat) and allow five minutes for the unit to reach steady state.

2- While waiting for the unit to stabilize, notice the flame. The flame should be stable without flashback and should not lift from the burner heads. Natural gas should burn basically blue with some clear streaks. L.P. gas should burn mostly blue with some clear yellow streaks.

3- After allowing the unit to stabilize for five minutes, record the manifold pressure and compare to the values given for gas supply pressure (above).

⚠ CAUTION

Disconnect heating demand as soon as an accurate reading has been obtained.

5-Proper Gas Flow

To check for proper gas flow to burners, determine Btuh input from unit rating plate or the gas heating capacity tables on page 4. Divide this input rating by the Btuh per cubic foot of available gas. Result is the number of cubic feet per hour required. Determine the flow of gas through gas meter for two minutes and multiply by 30 to get hourly flow of gas to the burners.

NOTE - To obtain accurate reading, shut off all other gas appliances connected to meter.

6-High Altitude Derate

Natural gas units may be installed at altitudes up to 2000 feet (610m) above sea level without any modification. At altitudes above 2000 feet (610 m), units must be derated to match gas manifold pressures shown in the following table. *NOTE-This is the only permissible derate for these units.*

TABLE 27

Altitude - ft. (m)	Gas Manifold Pressure - in. w.g. (kPa)
2001 - 3000 (610 - 915)	3.6 (0.90)
3001 - 4000 (915 - 1220)	3.5 (0.87)
4001 - 5000 (1220 - 1525)	3.4 (0.85)
5001 - 6000 (1525 - 1830)	3.3 (0.82)
6001 - 7000 (1830 - 2135)	3.2 (0.80)
7001 - 8000 (2135 - 2440)	3.1 (0.77)

Derate Procedure:

1- Check manifold pressure at the gas valve pressure tap with unit operating at high fire (second stage).

2- To reduce maximum input, turn regulator adjusting screw (figure 24) counterclockwise.

3- Re-check manifold pressure.

7-Inshot Burner

Burners are factory set for maximum air and cannot be adjusted. Always operate unit with access panel in place. A peep hole is furnished in the heating access panel for flame viewing. Natural gas should burn basically blue with some clear streaks. L.P. gas should burn mostly blue with some clear yellow streaks.

Figure 31 shows how to remove burner assembly.

1- Turn off power to unit and shut off gas supply.

2- Remove screws holding the burner support cap.

3- Slide each burner off its orifice.

4- Clean and reassemble (reverse steps 1-3).

5- Be sure to secure all wires and check plumbing.

6- Turn on power to unit. Follow lighting instructions attached to unit and operate unit in heating mode. Check burner flames. They should be blue with yellow streaks.

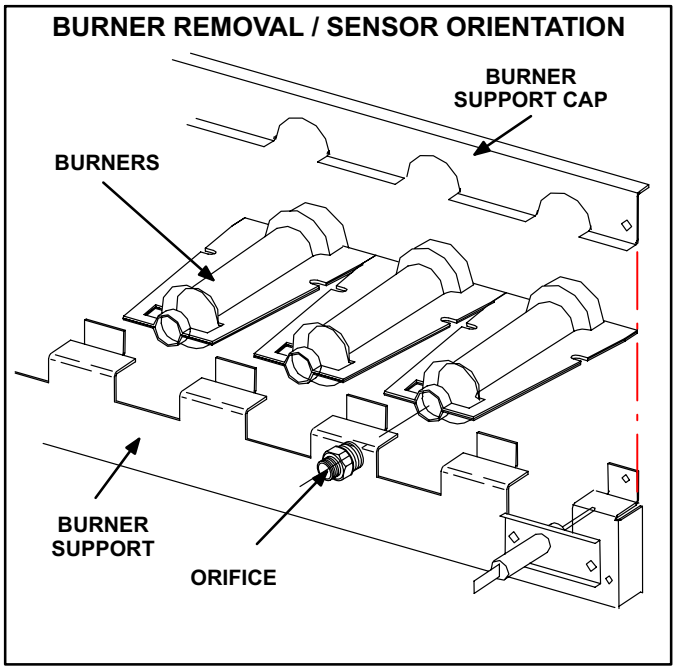

FIGURE 31

8-Heat Exchanger

To Access or Remove Heat Exchanger From Unit:

1- Turn off gas and electric power.

2- Remove access panel(s) and unit center mullion.

3- Remove gas valve, manifold assembly and burners.

4- Remove combustion air blower and flue box. Pay careful attention to the order in which gaskets and orifice are removed.

5- Support heat exchanger (to prevent it from falling when final screws are removed.)

6- Remove screws supporting heat exchanger.

7- To install heat exchanger, reverse procedure. Be sure to secure all wires and check plumbing and burner plate for airtight seal. Screws must be torqued to 35 in.-lbs. (155.7 N) to ensure proper operation.

9-Spark Electrode Gap

The spark electrode assembly can be removed for inspection by removing two screws securing the electrode assembly and sliding it out of unit.

For proper unit operation, electrodes must be positioned and gapped correctly.

Spark gap may be checked with appropriately sized twist drills or feeler gauges. Disconnect power to the unit and remove electrode assembly. The gap should be between 0.125" ± 0.015" (3.2 mm ± .4 mm). See figure 25.

10-Flame Sensing

Flame current is an electrical current which passes from the ignition control through the sensor electrode during unit operation. The current passes from the sensor through the flame to the ground electrode (located on the flame electrode) to complete a safety circuit. The electrodes should be located so the tips are at least 1/2" (12.7 mm) inside the flame envelope. Do not bend electrodes. To measure flame current, follow the procedure below:

TABLE 28

Manufacturer	Nominal Signal Microamps	Drop Out
RAM	1.7-3.6	0.5
JOHNSON	0.5-1.0	.09
FENWALL	1.7-3.6	0.7

NOTE-Electrodes are not field adjustable. Any alterations to the electrode may create a hazardous condition that can cause property or personal injury.

1- Disconnect power to unit.

2- Remove lead from sensing electrode and install a 0-50DC microamp meter in series between the sensing electrode and the sensing lead.

3- Reconnect power and adjust thermostat for heating demand.

4- When flame is established, compare reading to table 28. Do not bend electrodes.

5- Disconnect power to unit before disconnecting meter. Make sure sensor wire is securely reconnected before reconnecting power to unit.

NOTE-If the meter scale reads 0, the leads are reversed. Disconnect power and reconnect leads for proper polarity.

11-Combustion Air Blower

The combustion air blower is factory set and is not field adjustable. However, operation should be monitored to ensure proper operation. The combustion air blower is used to draw fresh air into the combustion chamber while simultaneously expelling exhaust gases. The blower operates throughout the heating cycle.

On a heating demand, the ignition control is energized by the main control module A55. The ignition control then allows 30 to 40 seconds for the combustion air blower to vent exhaust gases from the burners. When the combustion air blower is purging the exhaust gases, the combustion air prove switch is closing proving that the combustion air blower is operating before allowing the ignition control to energize. When the combustion air prove switch is closed and the delay is over, the ignition control activates the first stage operator of the gas valve (low fire), the spark and the flame sensing electrode. Sparking stops immediately after flame is sensed.

B-Cooling System Service Checks

All models are factory charged and require no further adjustment; however, charge should be checked periodically using the approach method. The approach method compares actual liquid temperature with the outdoor ambient temperature.

1-Gauge Manifold Attachment

Service gauge ports are identified in figures 11, 12 and 13 on pages 23, 24, and 25 respectively. Attach high pressure line to discharge line schrader port and the low pressure line to the suction line schrader port.

NOTE-When unit is properly charged discharge line pressures should approximate those in tables 11 through 22.

VI-MAINTENANCE

NOTE - TURN OFF POWER TO UNIT BEFORE CLEANING OR PERFORMING ANY SERVICE OPERATION TO THIS UNIT.

A-Filters

All models are equipped with six 24" x 24" x 2" (610mm x 610mm x 51mm) pleated throw-away type filters. Filters may be accessed through the economizer / filter access door (left of the blower door). All filters are removed by pulling on the pull tab, located on the bottom of each row of filters. Filters should be checked monthly (or more frequently in severe use) and cleaned or replaced regularly. Take note of the "AIR FLOW DIRECTION" marking on the filter frame when re-installing.

NOTE-Filters must be U.L.C. certified or equivalent for use in Canada.

B-Lubrication

All motors and blower wheels used in LGA / LCA / LHA units are prelubricated; no further lubrication is required.

C-Supply Air Blower Wheel

Annually inspect supply air blower wheel for accumulated dirt or dust. Turn off power before attempting to remove access panel or to clean blower wheel.

D-Evaporator Coil

Inspect and clean coil at beginning of each season. Clean using mild detergent or commercial coil cleanser. Check condensate drain pan and line, if necessary. Flush coil and condensate drain with water taking care not to get insulation, filters and return air ducts wet. Check connecting lines and coil for evidence of oil and refrigerant leaks.

E-Condenser Coil

Clean condenser coil annually with detergent or commercial coil cleaner and inspect monthly during the cooling season. Check connecting lines and coil for evidence of oil and refrigerant leaks.

NOTE-If owner complains of insufficient cooling, the unit should be gauged and refrigerant charge checked. Refer to Gauge Manifold Attachment and Charging sections in this manual.

F-Electrical

1- Check all wiring for loose connections.

2- Check for correct voltage at unit (unit operating).

3- Check amp-draw on both condenser fan motor and blower motor.
Fan Motor Rating Plate ____ Actual _____
Indoor Blower Motor Rating Plate____ Actual____

VII-ACCESSORIES

The accessories section describes the application of most of the optional accessories which can be factory or field installed to either the LGA / LCA / LHA units.

A-LARMF18/36-14, 24 or LARMFH18/24-26, 37 Mounting Frames

When installing either the LGA / LCA / LHA units on a combustible surface for downflow discharge applications, the Lennox LARMF18/36 14-inch or 24-inch (356 mm or 610mm) height roof mounting frame is used. For horizontal discharge applications, use LARMFH18/24 26-inch or 37-inch (660mm or 940mm) height roof mounting frame. This frame converts unit from down-flow to horizontal air flow. The 37 inch (940mm) horizontal frame meets National Roofing Code requirements. The roof mounting frames are recommended in all other applications but not required. If the LGA / LCA / LHA units are not mounted on a flat (roof) surface, they MUST be supported under all edges and under the middle of the unit to prevent sagging. The units MUST be mounted level within 1/16" per linear foot or 5mm per meter in any direction.

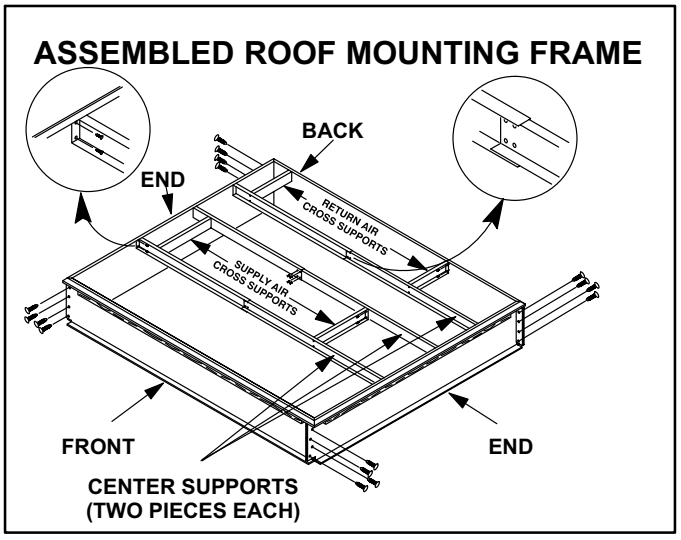

FIGURE 32

The assembled LARMF18/36 mounting frame is shown in figure 32. Refer to the roof mounting frame installation instructions for details of proper assembly and mounting. The roof mounting frame MUST be squared to the roof and level before mounting. Plenum system MUST be installed before the unit is set on the mounting frame. Typical roof curbing and flashing is shown in figure 33. Refer to the roof mounting frame installation instructions for proper plenum construction and attachment.

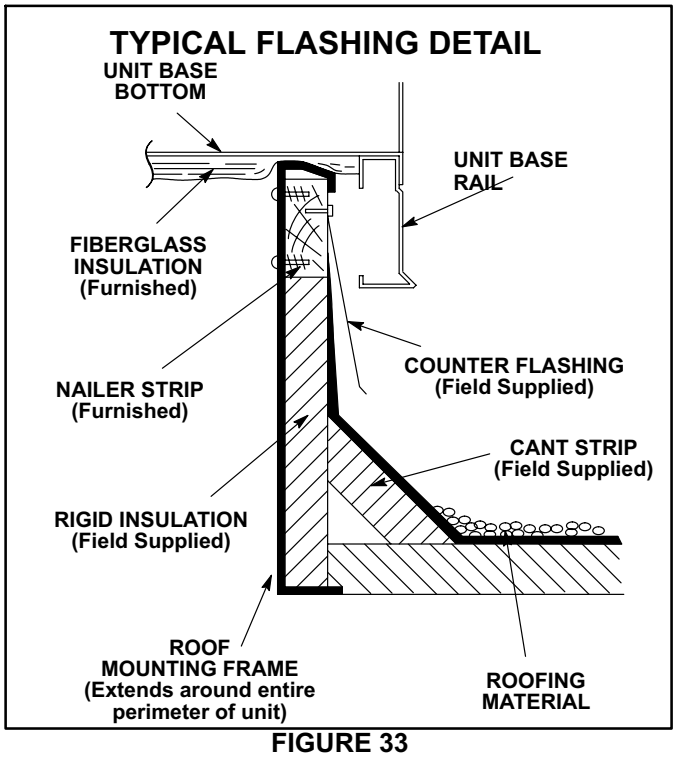

FIGURE 33

B-Transitions

Optional supply/return transitions LASRT18/21/24 are available for use with LGA / LCA / LHA series units utilizing optional LARMF18/36 roof mounting frame. Transition must be installed in the LARMF18/36 mounting frame before mounting the unit to the frame. Refer to the manufacturer's instructions included with the transition for detailed installation procedures.

C-Supply and Return Diffusers

Optional flush mount diffuser/return FD11 and extended mount diffuser/return RTD11 are available for use with the LGA / LCA / LHA units. Refer to manufacturer's instructions included with transition for detailed installation procedures.

D-LAOAD(M)18/24 Outdoor Air Dampers

LAOAD(M)18/24 consists of a set of dampers which may be manually or motor (M) operated to allow up to 25 percent outside air into the system at all times (see figure 34). Both air dampers can be installed in LGA / LHA / LCA units. Washable filter supplied with the outdoor air dampers can be cleaned with water and a mild detergent.It should be sprayed with Filter Handicoater when dry prior to reinstallation.Filter Handicoater is R.P. Products coating no. 418 and is available as Lennox Part No. P-8-5069.

E-LAREMD18/24 Economizer

(Field or Factory Installed)

The optional LAREMD18/24 economizer can be used with LGA / LCA / LHA units in downflow and horizontal air discharge applications. The LAREMD18 / 24 economizer uses outdoor air for free cooling when temperature and/or humidity is suitable. An economizer hood is required and must be ordered separately.

NOTE - Gravity exhaust dampers are required with power exhaust.

The economizer is controlled by the economizer control module A56 which connects to the main control module A55. Both boards are part of the Integrated Modular Control (IMC) which controls "L" series unit operation.

The economizer will operate in one of four modes. Each mode requires a different EM1 economizer DIP switch setting. Each mode also requires different sensors.

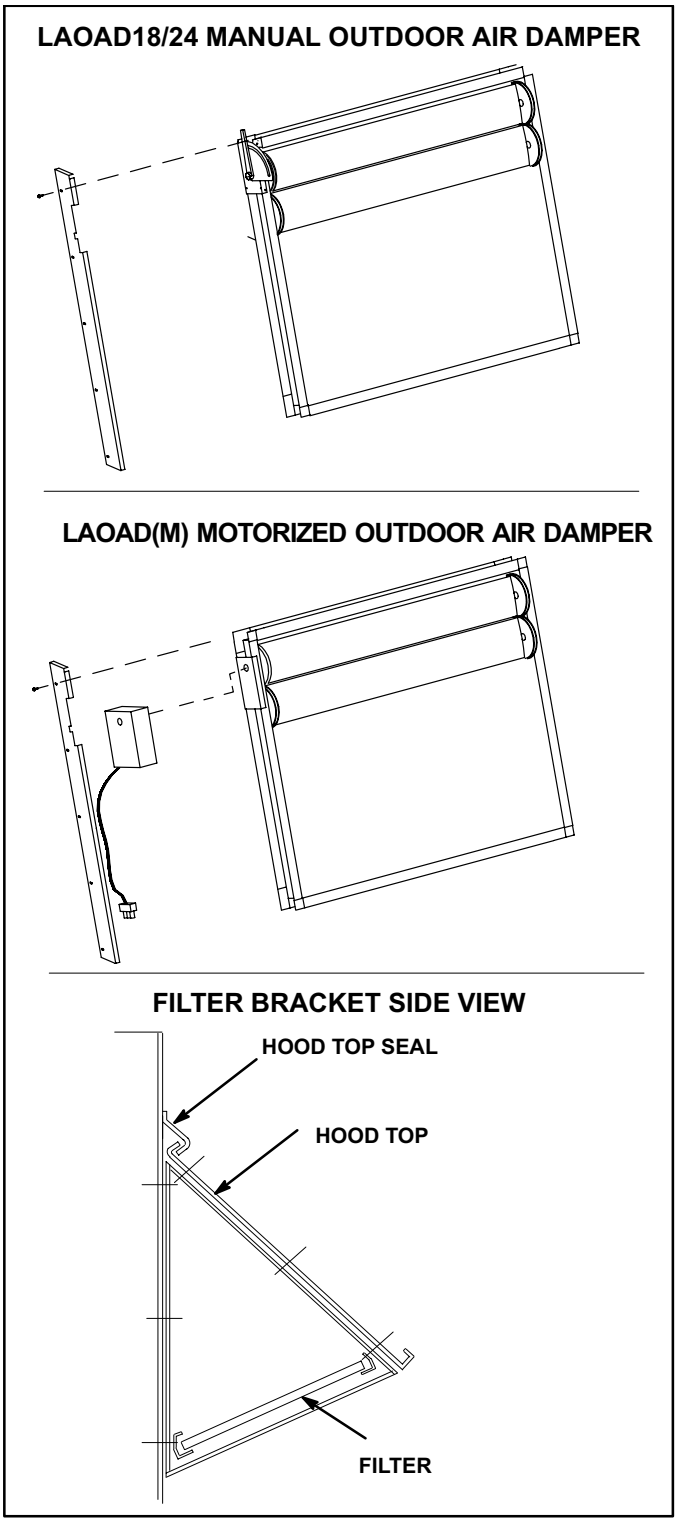

FIGURE 34

1-"TMP" MODE (SENSIBLE TEMPERATURE)

In the "TMP" mode, the IMC uses input from the factory installed RT6 Supply Air Sensor, RT16 Return Air Sensor, and RT17 Outdoor Air Sensor to determine suitability of outside air and economizer damper operation. When outdoor sensible

temperature is less than return air sensible temperature, outdoor air is used for cooling. This may be supplemented by mechanical cooling to meet comfort demands. This application does not require additional optional sensors.

2-"ODE" MODE (OUTDOOR ENTHALPY)

The "ODE" or outdoor enthalpy mode requires a field-provided and -installed Honeywell C7400 enthalpy sensor (16K96). The sensor monitors outdoor air temperature and humidity (enthalpy). When outdoor air enthalpy is below the enthalpy control setpoint, the economizer modulates to allow outdoor air for free cooling.

3-"DIF" MODE (DIFFERENTIAL ENTHALPY)

The "DIF" or differential enthalpy mode requires two field-provided and -installed Honeywell C7400 enthalpy sensors (16K97). One sensor is installed in the outside air opening and the other sensor is installed in the return air opening. When the outdoor air enthalpy is below the return air enthalpy, the economizer opens to bring in outdoor air for free cooling.

4-"GLO" MODE (GLOBAL)

Global Mode - The "GLO" or global mode is used with an energy management system which includes a global control feature. Global control is used when multiple units (in one location) respond to a single outdoor air sensor. Each energy management system uses a specific type of outdoor sensor which is installed and wired by the controls contractor.

Motorized Outdoor Air Damper - The "GLO" mode is also used when a motorized outdoor air damper is installed in the system.

NOTE - All economizer modes of operation will modulate dampers to 55° F (13° C) supply air.

F-LAGED(H)18/24 Gravity Exhaust Dampers

LAGED(H)18/24 dampers are used with LGA / LCA / LHA series units. LAGED dampers are used in downflow and LAGEDH are used in horizontal air discharge applications. LAGED(H) gravity exhaust dampers are installed in the return air plenum (see figure 35). The dampers must be used any time an economizer or power exhaust fans are applied to LGA / LCA / LHA series units.

Gravity exhaust dampers allow exhaust air to be discharged from the system when an economizer and/or power exhaust is operating. Gravity exhaust dampers also prevent outdoor air infiltration during unit off cycle. See installation instructions for more detail.

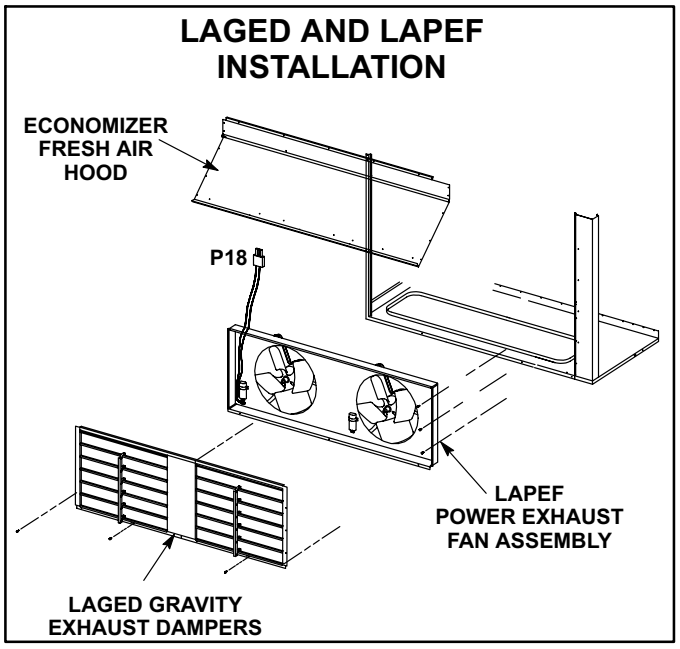

FIGURE 35

G-LAPEF18/24 Power Exhaust Fans

LAPEF18/24 power exhaust fans are used with LGA / LCA / LHA series units. LAPEF (requires optional down-flow gravity exhaust dampers and LAREMD economizers) are used in downflow applications only. Power exhaust fans provide exhaust air pressure relief and also run when return air dampers are closed and supply air blowers are operating. Figure 35 shows location of the LAPEF. See installation instructions for more detail.

H-Optional Cold Weather Kit (Canada only)

Electric heater is available to automatically control the minimum temperature in the gas burner compartment. Heater is C.G.A. certified to allow cold weather operation of unit down to -60°F (-50°C).

The kit includes the following parts:

1- Transformer (T20) is a 600V to 120/240V stepdown transformer mounted in the blower compartment.

2- T20 has two in line fuses (F20), one on each leg of the transformer. Both are rated at 15 amps.

3- The strip heater (HR6) is located as close as possible to the gas valve. It is wired in series with T20. The strip heater is rated at 500 Watts

4- A thermostat mounting box is installed on the vestibule of the heating compartment. Included in the box are the following thermostat switches:

a - Thermostat switch (S59) is an auto-reset SPST N.C. switch which opens on a temperature drop. The switch is wired in series with 24v power and the combustion air blower switch. When the temperature

drops below -20°F (28.9°C) the switch opens and the gas heat section is de-energized. The switch automatically resets when the heating compartment temperature reaches 10°F (-12.2°C).

b - Thermostat switch (S60) is an auto-reset SPST N.C. switch which opens on a temperature rise. The switch is wired in series with HR6 and T20. When the temperature rises above 20°F (-6.7°C) the switch opens and the electric heater is de-energized. The switch automatically resets when the heating compartment temperature reaches -10°F (23.3°C).

c -Thermostat switch (S61) is an auto-reset SPST N.O. switch which closes on a temperature drop. The switch is wired in series with HR6 and T20. When temperature drops below 20°F (-6.7°C) the switch closes and electric heater is energized. The switch automatically opens when heating compartment temperature reaches 50°F (10°C).

I-Control Systems

Three different types of control systems may be used with the LGA / LCA / LHA series units. All thermostat wiring is connected to terminal block TB1 located in the control box of the unit. Each thermostat has additional control options available. See thermostat installation instructions for more detail.

1- Electro-mechanical thermostat (13F06)

The electro-mechanical thermostat is a two stage heat / two stage cool thermostat with dual temperature levers. A non-switching or manual system switch subbase may be used.

2- Electronic thermostat (see price book)

Any two stage heat / two stage cool electronic thermostat may be used.

3- Honeywell T7300 thermostat (81G59)

The Honeywell T7300 thermostat is a programmable, internal or optional remote temperature sensing thermostat. The T7300 provides occupied and unoccupied changeover control.

J-Smoke Detectors A17 and A64

Photoelectric smoke detectors are a factory installed option. The smoke detectors can be installed in the supply air section (A64), return air section (A17), or in both the supply and return air section. Wiring for the smoke detectors are shown on the temperature control section (C2) wiring diagram in back of this manual.

K-Blower Proving Switch S52

The blower proving switch monitors blower operation and locks out the unit in case of blower failure. The switch is N.O. and closes at .14" W.C. (34.9 Pa) The switch is mounted on the upper left hand corner of the blower deck. Wiring for the blower proving switch is shown on the temperature control section (C2) wiring diagram in back of this manual.

L-Dirty Filter Switch S27

The dirty filter switch senses static pressure increase indicating a dirty filter condition. The switch is N.O. and closes at 1" W.C. (248.6 Pa) The switch is mounted on the top filter channel corner. Wiring for the dirty filter switch is shown on the temperature control section (C2) wiring diagram in back of this manual.

M-Indoor Air Quality (CO_2) Sensor A63

The indoor air quality sensor monitors CO_2 levels and reports the levels to the main control module A55. The board adjusts the economizer dampers according to the CO_2 levels. The sensor is mounted next to the indoor thermostat or in the return air duct. Refer to the indoor air quality sensor installation instructions for proper adjustment. Wiring for the indoor air quality switch is shown on the temperature control section (C2) wiring diagram in back of this manual.

N-LP / Propane Kit

Two natural to LP / propane gas changeover kits are required for gas conversion on LGA180/210/240 series units (one for each gas heat section). The kit includes one gas valve, eleven burner orifices, and three stickers. For more detail refer to the natural to LP gas changover kit installation instructions.

O-Factory Installed Humiditrol LGA/LCA180, 210 & 240 Units

General

Humiditrol units provide a dehumidifying mode of operation. These units contain a reheat coil adjacent to and downstream of the evaporator coil. Reheat coil solenoid valves, L14 and L30, route hot discharge gas from the compressor to the reheat coil. Return air pulled across the evaporator coil is cooled and dehumidified; the reheat coil adds heat to supply air.

See figure 36 for RH1 reheat control board, figure 37 for 180 reheat refrigerant routing, figure 38 for 180 standard cooling refrigerant routing, figure 39 for 210 and 240 reheat refrigerant routing, and figure 40 for 210 and 240 standard cooling refrigerant routing.

L14 and L30 Reheat Coil Solenoid Valves

When IMC board input (P114-10) indicates room conditions require dehumidification, L14 and L30 reheat valves are energized (RH1 board P175-3 and -4) and refrigerant is routed to the reheat coil.

RH1 Humiditrol Board

The RH1 add-on board is factory-installed in all Humiditrol units. RH1 is located on the M1 board underneath either the A58 (G1) or A60 (E1) board.

Reheat Setpoint

Reheat is factory-set to energize when indoor relative humidity rises above 60% (default). Reheat will terminate when the indoor relative humidity falls 3% below setpoint, or 57% (default). The reheat setpoint can be adjusted by changing ECTO 4.25 . A setting of 100% will disable reheat. The reheat setpoint can also be adjusted using an optional Network Control Panel (NCP).

A91 Humidity Sensor

Relative humidity should correspond to the sensor (A91) output voltage listed in table 29. For example: if indoor air relative humidity is 80% ± 3%, the humidity sensor output should read 8.00VDC.

Check the sensor output annually for accuracy. Keep the air intake openings on the sensor clean and free of obstructions and debris.

Read Relative Humidity At IMC

Turn MODE DIP "TEMP" switch #4 "ON". Display will alternately flash from readout to output. A single push on the pushbutton will toggle the readout upward from .0 to .7 incrementally. A double push will toggle the readout downward from .7 to .0 incrementally. Readout .7 indicates percent relative humidity.

TABLE 29

Relative Humidity (%RH ± 3%)	Sensor Output (VDC)
20	2.00
30	3.00
40	4.00
50	5.00
60	6.00
70	7.00
80	8.00
90	9.00

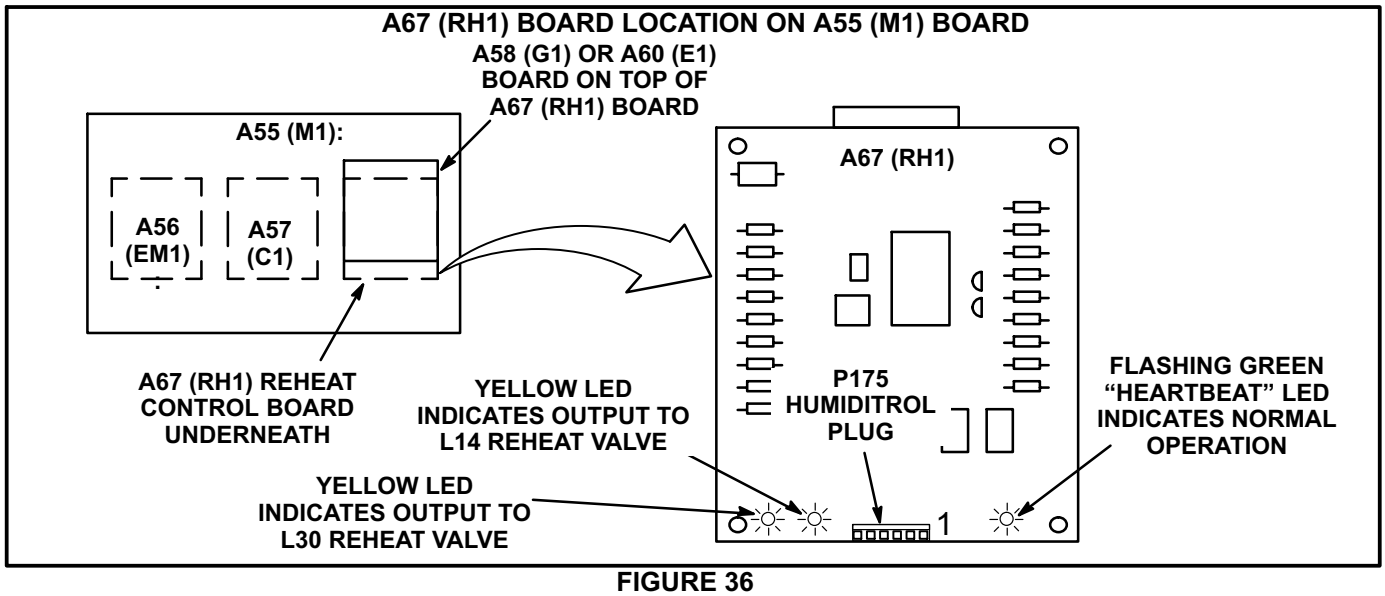

FIGURE 36

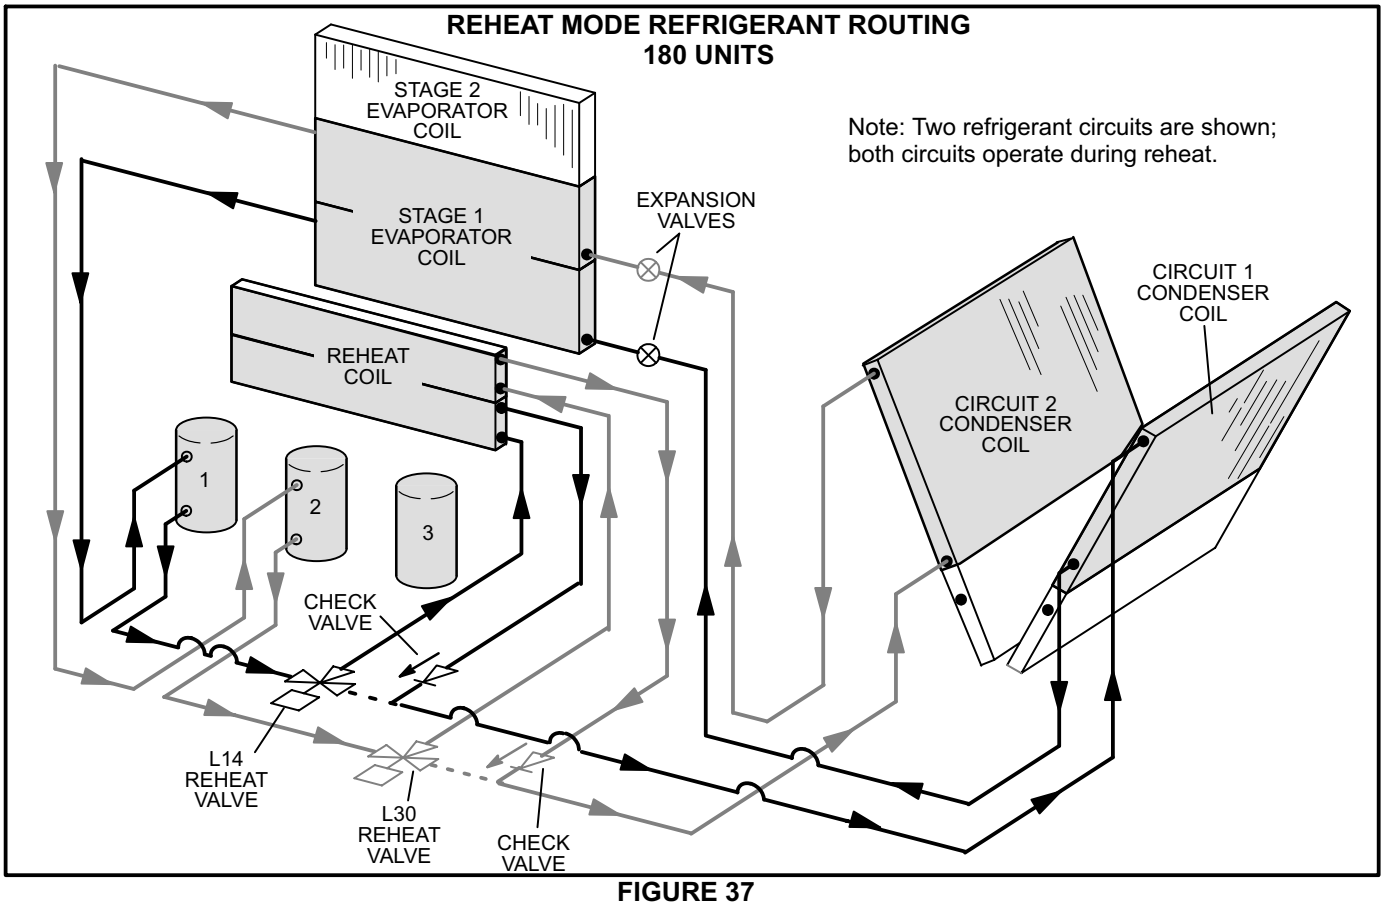

FIGURE 37

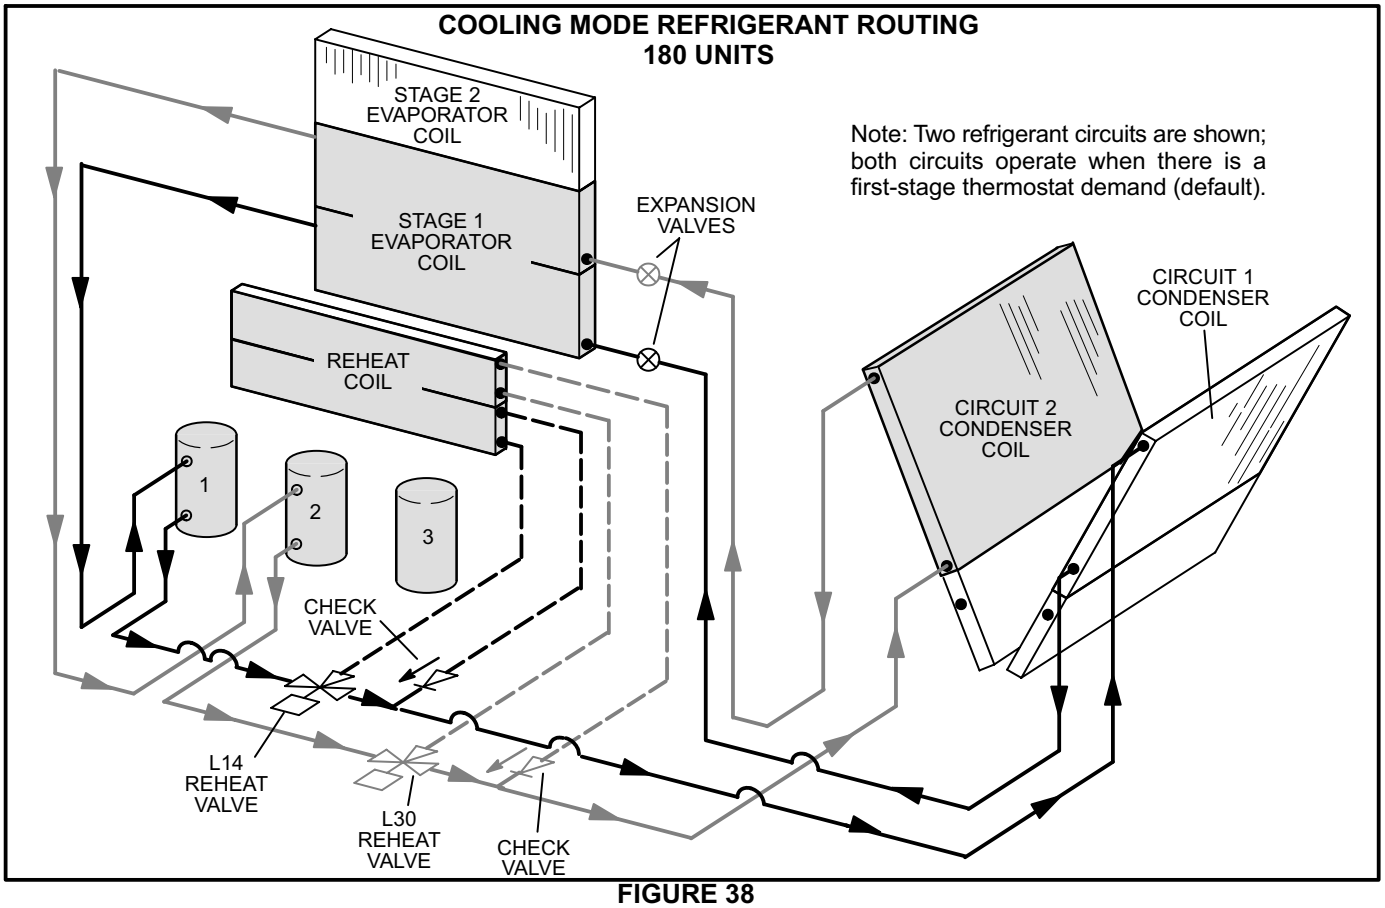

FIGURE 38

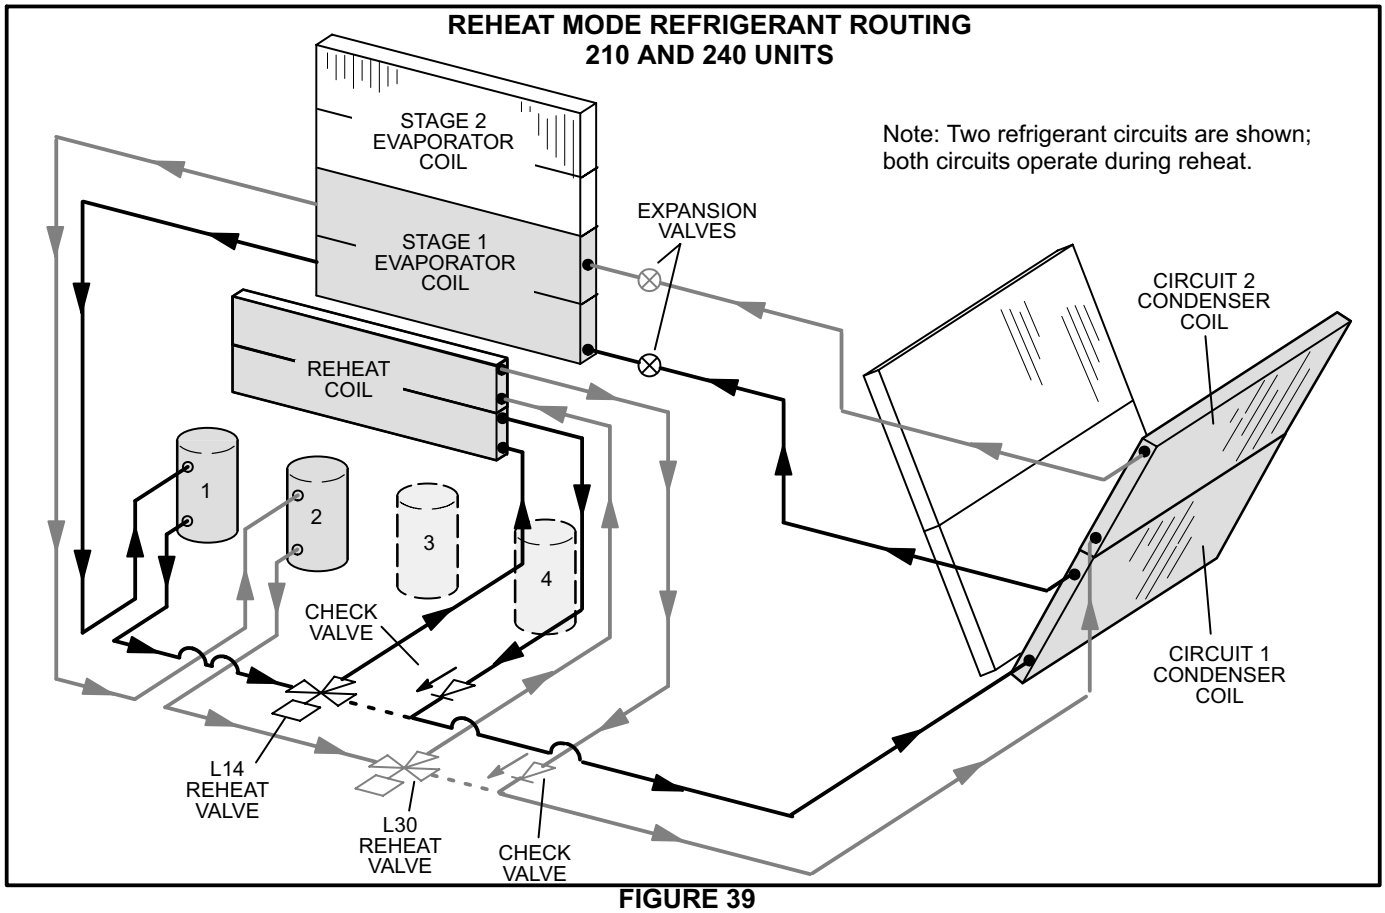

FIGURE 39

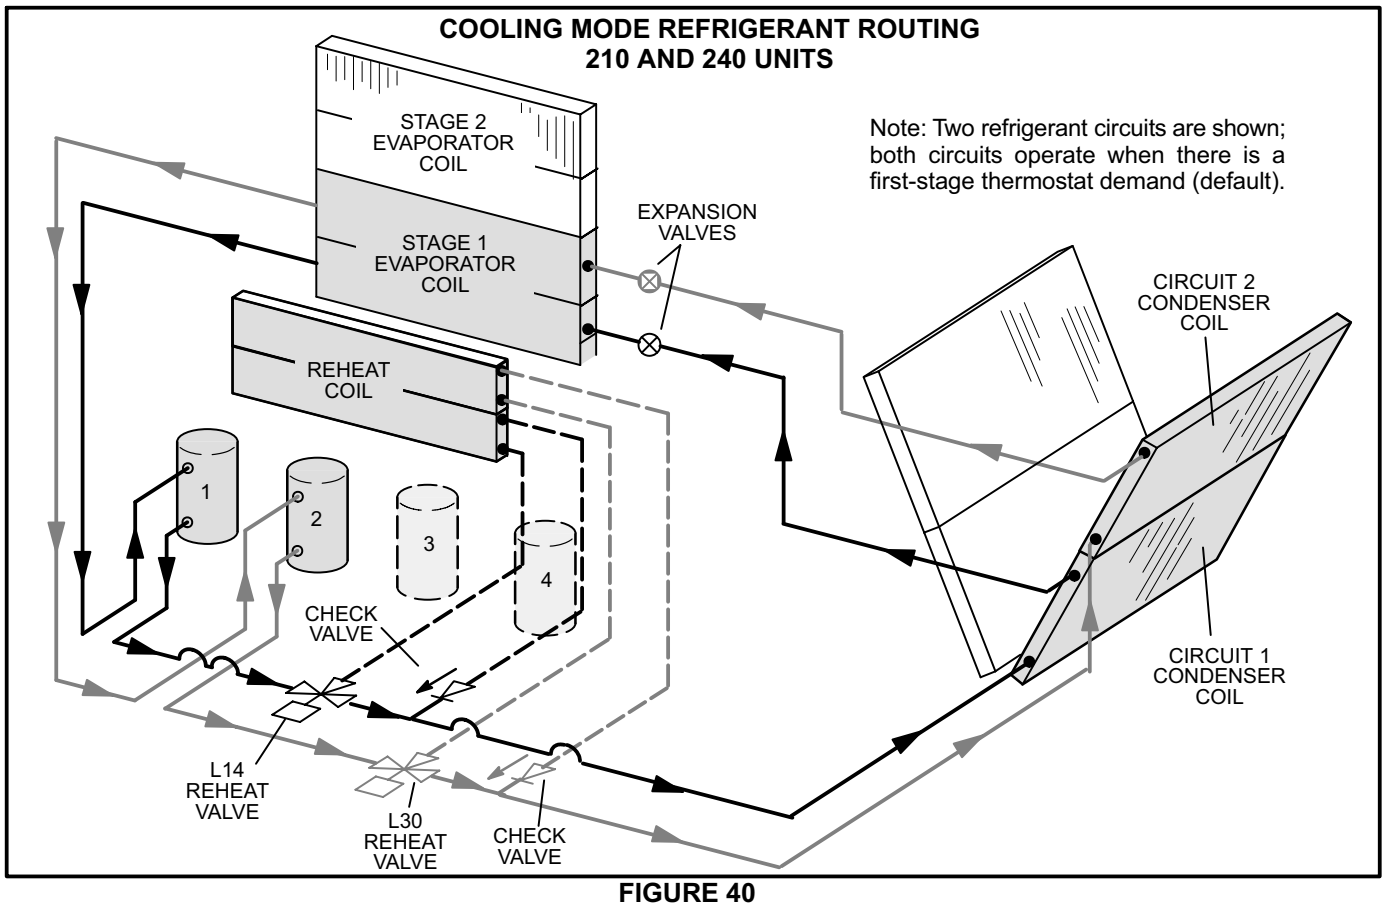

FIGURE 40

Check-Out

Test Humiditrol operation using the following procedure.

1- Make sure RH sensor is wired as shown in figure 41 or 42.

2- Set IMC ECTO system mode parameter 6.01 to option 0 (default local thermostat mode).

3- Set IMC ECTO reheat setpoint parameter 4.25 to option 0 (% relative humidity).

4- Jumper the following TB1 terminals:
7 & 8 (occupied mode)
6 & 3 (blower demand G)
6 & 18 (Y1 cooling demand)

On 156 and 180 units, the blower, compressor 1 and compressor 2 (reheat), and compressor 3 (cooling) should be operating. On 210, 240, and 300S units, the blower, compressor 1 and compressor 2 (reheat), and compressor 3 and 4 (cooling) should be operating. L14 and L30 LED's on the A67 board should also be ON, indicating the reheat valves are energized.

5- Disconnect the jumper between TB1 terminals 6 & 18 (Y1) to end the cooling demand.

6- Press the IMC pushbutton to by-pass the compressor minimum run delay.

180 Units -

Compressor 3 (cooling) should de-energize, compressor 1 and 2 (reheat) should continue to operate, and L14 and L30 LED's should still be ON.

210 and 240 Units -

Compressor 3 and 4 (cooling) should de-energize, compressor 1 and 2 (reheat) should continue to operate, and L14 and L30 LED's should still be ON.

7- Disconnect the jumper between TB1 terminals 7&8 (occupied mode).

Compressor 1 and 2 (reheat) should de-energize, L14 and L30 LED's should go OFF, blower should still be energized.

8- When check-out is complete, remove all jumpers, set ECTO 4.25 back to the proper humidity setpoint, and set ECTO 6.01 to the proper setting.

Reheat Operation

The following conditions must be met before reheat will be energized:

1- Blower must be operating.

2- System must be in occupied mode.

3- System must NOT be operating in heating mode.

4- One cooling demand is required if the unit has been in heating mode, the IMC has been reset, or at initial unit start-up.

IMPORTANT - Free cooling does not operate during reheat. Free cooling will operate as shown in the IMC manual.

Reheat will operate as shown in table 30.

Units are shipped from the factory to provide two stages of cooling. (ECTO 5.04 option 2 and 6.01 option 0).

Three stages of cooling is available in zone sensor mode (ECTO 6.01 set to option 1, 2, or 3). Three stages of cooling is also available by installing a transfer relay and a three-stage thermostat; ECTO 5.04 must be set to option 3. Refer to the Main Control Operation section in the IMC manual when using the transfer relay.

Four stages of cooling is available in zone sensor mode (ECTO 6.01 set to option 1, 2, or 3) on units with four compressors (C210, 240, 300S).

Compressors are not de-energized when unit operation changes from cooling to reheat or from reheat to cooling. Instead, L14 and L30 reheat valves are energized (reheat) or de-energized (cooling).

NOTE - Another thermostat staging option is available which allows both compressors to be energized during free cooling. See ECTO 5.04 option 1 in IMC manual.

24 VOLT FIELD WIRING WITH IMC SET IN LOCAL THERMOSTAT MODE (ECTO 6.01 OPTION 0)

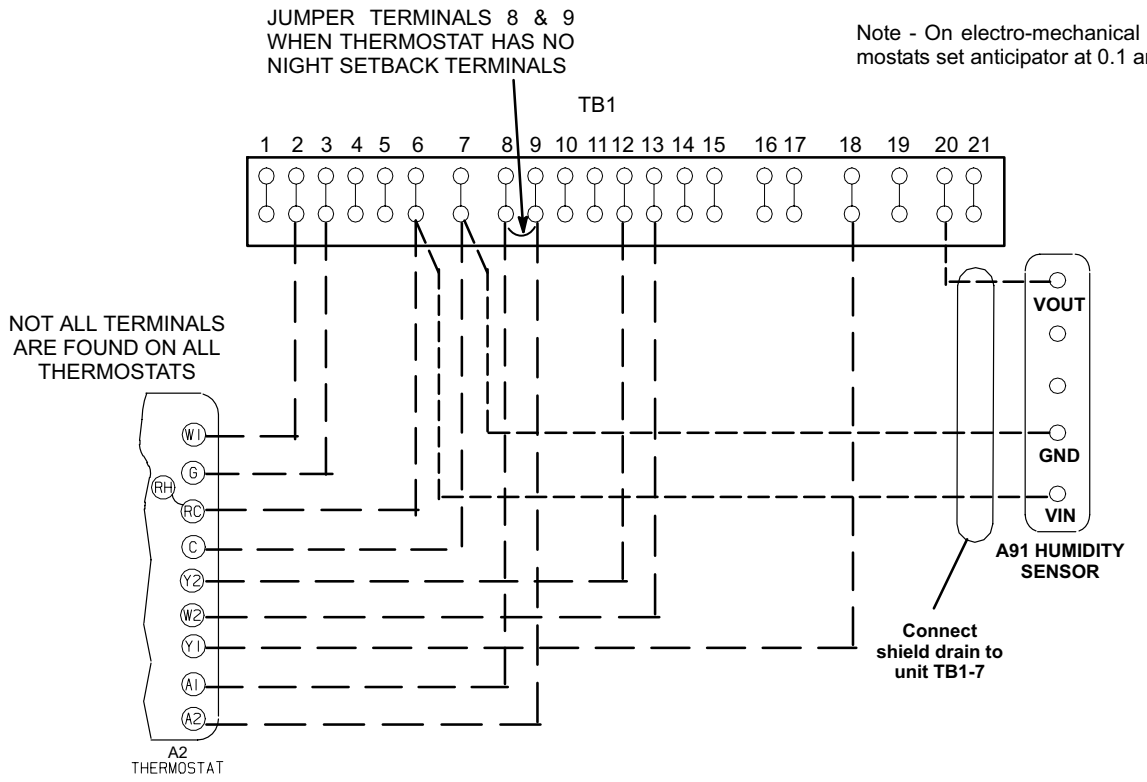

FIGURE 41

24 VOLT FIELD WIRING IN ZONE SENSOR MODE (ECTO 6.01 OPTION 1, 2, OR 3)

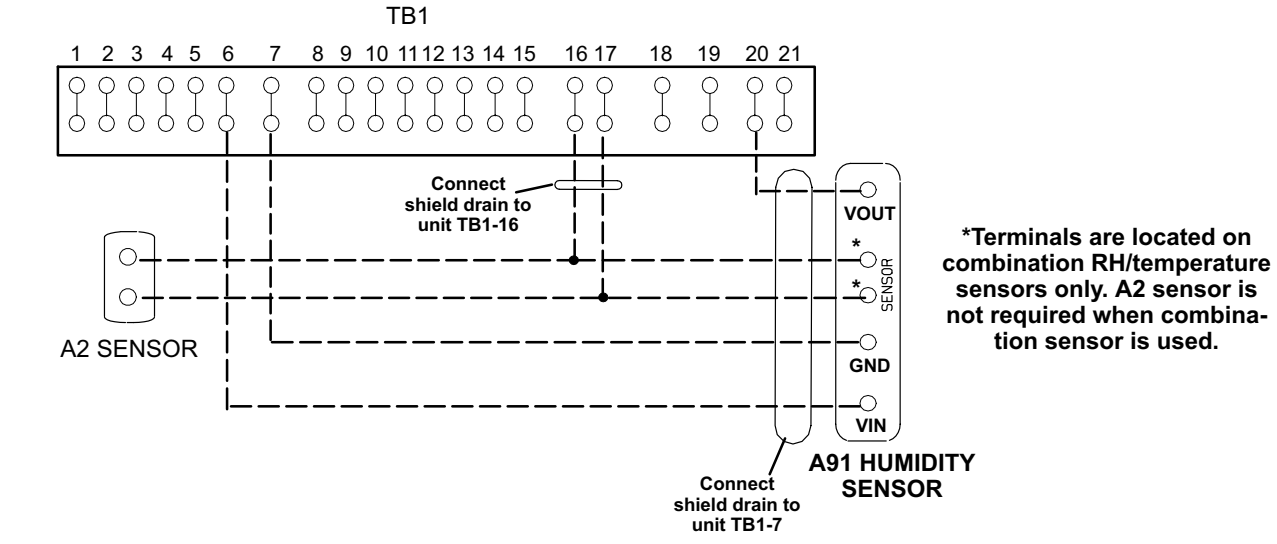

FIGURE 42

TABLE 30
REHEAT OPERATION

Two-Stage Thermostat - Default		
T'stat and Humidity Demands	Operation	
	180 (3-Compressors)	210 and 240 (4-Compressors)
Reheat Only	Compressor 1 & 2 Reheat	Compressor 1 & 2 Reheat
Reheat & Y1	Compressor 1 & 2 Reheat and Compressor 3 Cooling[1]	Compressor 1 & 2 Reheat and Compressor 3 & 4 Cooling[1]
Reheat &Y1 & Y2	Compressor 1, 2, & 3 Cooling[3]	Compressor 1, 2, 3 & 4 Cooling[3]
Three-Stage Thermostat (Transfer relay required)		
T'stat and Humidity Demands	Operation	
	180 (3-Compressors)	210 and 240 (4-Compressors)
Reheat Only	Compressor 1 & 2 Reheat	Compressor 1 & 2 Reheat
Reheat & Y1	Compressor 1 & 2 Reheat and Compressor 3 Cooling[1]	Compressor 1 & 2 Reheat and Compressor 3 Cooling[1]
Reheat Y1 & Y2	Compressor 1, & 2, Cooling[2]	Compressor 1 & 2 Reheat and Compressor 3, & 4 Cooling[3]
Reheat Y1 & Y2 & Y3	Compressor 1, 2, & 3 Cooling[3]	Compressor 1, 2, 3, & 4 Cooling[4]
Four-Stage Zone Sensor Mode		
Cooling* and Humidity** Demands	Operation	
	180 (3-Compressors)	210 and 240 (4-Compressors)
Reheat Only	Compressor 1 & 2 Reheat	Compressor 1 & 2 Reheat
Reheat & Y1	Compressor 1 & 2 Reheat and Compressor 3 Cooling[1]	Compressor 1 & 2 Reheat and Compressor 3 Cooling[1]
Reheat & Y1 & Y2	Compressor 1, & 2, Cooling[2]	Compressor 1 & 2 Reheat and Compressor 3 & 4 Cooling[2]
Reheat & Y1 & Y2 & Y3	Compressor 1, 2, & 3 Cooling[3]	Compressor 1, 2, & 3 Cooling[3]
Reheat & Y1 & Y2 & Y3 & Y4	Compressor 1, 2, & 3 Cooling[4]	Compressor 1, 2, 3, & 4 Cooling[5]

*Cooling stage is initiated when zone temperature is higher than the cooling setpoint plus the appropriate stage differential (ECTO 6.10, 6.12, 6.13, 6.14).

**Reheat demand is initiated when relative humidity is higher than relative humidity setpoint.

[1]If there is no reheat demand and outdoor air is suitable, free cooling will operate.

[2]If there is no reheat demand and outdoor air is suitable, free cooling and compressor 1 will operate.

[3]If there is no reheat demand and outdoor air is suitable, free cooling and compressor 1 and 2 will operate.

[4]If there is no reheat demand and outdoor air is suitable, free cooling, compressor 1, 2, and 3 will operate.

[5]If there is no reheat demand and outdoor air is suitable, free cooling, compressor 1, 2, 3, and 4 will operate.

The following conditions must be met before reheat will be energized:

1- Blower must be operating.

2- System must be in occupied mode.

3- System must NOT be operating in heating mode.

4- One cooling demand is required if the unit has been in heating mode, the IMC has been reset, or at initial unit start-up.

VIII-WIRING DIAGRAMS AND OPERATION SEQUENCE

The following pages contain the wiring diagrams for LGA, LCA, LHA156H/180/210/240/300S series units. An economizer and thermostat are also shown. Each wiring diagram is followed by a sequence of operation. The sequence is outlined by numbered steps which correspond to circled numbers on the wiring diagrams.

Each wiring diagram is identified with a letter A, B, C, or D followed by a number. Each LGA / LCA / LHA unit wiring diagram is assigned a "B" number (likewise, each control system is assigned a "C" number, each heating section an "A" number and each economizer diagram a "D" number). Use the numbers when joining the schematics to help you identify how the unit is set up.

SEQUENCE OF OPERATION
B7 DIAGRAM - LGA, LCA210/240/300S Y, G, J
(B6 DIAGRAM - LGA, LCA156H/180 Y, G, J SIMILAR)

Power:

1- Line voltage from TB2, unit disconnect S48, or other factory or field installed optional power disconnects, such as CB10, energizes transformer T1 and T18. Transformer T1 provides 24VAC power to terminal strip TB34 and T18 provides 24VAC power to terminal strip TB35. The two terminal strips provide 24VAC power to the unit cooling, heating and blower controls and thermostat.

2- Terminal strip TB13 is also energized when the unit disconnect closes. TB13 supplies line voltage to compressor crankcase heaters, compressors, blower motors, and fan motors.

Blower Operation (OCP input must be on):

3- The main control module A55 receives a demand from thermostat terminal G. A55 energizes blower contactor K3 with 24VAC.

4- N.O. K3-1 closes, energizing blower B3.

Economizer Operation:

5- The economizer control module A56 receives a demand and energizes exhaust fan relay K65 with 24VAC at 50% (travel) outside air damper open (adjustable).

6- N.O. K65-1 and K65-2 both close, energizing exhaust fan motors B10 and B11.

1st Stage Cooling (both compressors B1 and B2 are energized):

7- First stage cooling demand energizes Y1 and G in the thermostat. G energizes blower, if blower is not already running (see step 3).

8- 24VAC is routed through TB34 to the main control module A55. After A55 proves N.C. low pressure switch S87, N.C. freezestat S49, and N.C. high pressure switch S4, compressor contactor K1 is energized.

9- N.O. contacts K1-1 close energizing compressor B1.

10-N.O. low ambient switch S11 and S84 close to energize condenser fan contactor K10.

NOTE: In 15 ton (52.8 kW) units, K10 is energized after K159-1 closes. K159 is energized by TB35 after one of the N.O. low ambient pressure switches S11, S84, and S85 closes.

11- N.O. contacts K10-1 close energizing condenser fan B4 and N.C. contacts K10-2 open de-energizing compressor 1 crankcase heater HR1.

12- Simultaneous with step 8, 24VAC is routed through the compressor 2 control module A57. After A57 proves N.C. low pressure switch S88, N.C. freezestat S50, and N.C. high pressure switch S7, compressor contactor K2 is energized.

13- N.O. contacts K2-1 close energizing compressor B2.

14- Compressor 2 control module A57 energizes condenser fan 2 relay K68.

15- N.O. contacts K68-1 close energizing condenser fan B5 and N.C. contacts K68-2 open de-energizing compressor 2 crankcase heater HR2.

2nd Stage Cooling (B13 in 15 ton (52.8 kW)and both B13 and B20 in 17.5 and 20 ton [61.5 and 70.3 kW] are energized):

16- Second stage cooling demand energizes Y2.

17-24VAC is routed through TB35 to compressor 3 and 4 module A59. After A59 proves N.C. low pressure switches S98 and S97, N.C. freezestats S53 and S95, and N.C. high pressure switches S28 and S96, compressor contactors K14 and K146 are energized.

18- N.O. contacts K14-1 close energizing compressor B13.

19- N.O. contacts K146-1 close energizing compressor B20.

20-N.O. low ambient pressure switches S85 and S94 close to energize condenser fan relay K149.

NOTE: In 15 ton (52.8 kW) units, K149 is energized after K159-2 closes. K159 is energized by TB35 after one of the N.O. low ambient pressure switches S11, S84, and S85 closes.

21-N.O. contacts K149-1 close energizing condenser fan B21 and N.C. contacts K149-2 open de-energizing compressor 3 crankcase heater HR5.

22- Compressor 3 and 4 module A59 energizes condenser fan relay K150.

23-N.O. contacts K150-1 close energizing condenser fan B22 and N.C. contacts K150-2 open de-energizing compressor 4 crankcase heater HR11.

SEQUENCE OF OPERATION
B15 DIAGRAM - LHA180/240 Y, G, J

Power:

1- Line voltage from TB2, unit disconnect S48, or other factory or field installed optional power disconnects, such as CB10, energizes transformer T1. Transformer T1 provides 24VAC power to terminal strip TB34, which provides 24VAC power to the unit cooling, heating, and blower controls and thermostat.

2- Terminal strip TB13 is also energized when the unit disconnect closes. TB13 supplies line voltage to compressor crankcase heaters, compressors, blower motors, and fan motors.

Blower Operation (OCP input must be on):

3- The main control module A55 receives a demand from thermostat terminal G. A55 energizes blower contactor K3 with 24VAC.

4- N.O. K3-1 closes, energizing blower B3.

Economizer Operation:

5- The economizer control module A56 receives a demand and energizes exhaust fan relay K65 with 24VAC at 50% (travel) outside air damper open (adjustable).

6- N.O. K65-1 and K65-2 both close, energizing exhaust fan motors B10 and B11.

First Stage Cooling Demand (compressors B1 is energized):

7- Cooling demand energizes G and Y1 in the thermostat. G energizes blower (see step 3).

8- 24VAC is routed through TB34 to the main control module A55.

9- A55 proves N.O. defrost switch S6 and N.C. defrost termination switch S46 to energize reversing valve L1 and low ambient relay K58.

10- N.C. contacts K58-1 open, giving control of K10 fan relay to low ambient pressure switch S11.

11- A55 proves N.C. low pressure switch S87, N.C. freezestat S49, and N.C. high pressure switch S4 to energize compressor contactor K1.

12- Compressor protector A9 may be installed on J voltage units only.

13- N.O. contacts K1-1 close energizing compressor B1.

14-24VAC is routed through N.O. low ambient pressure switch S11 (now closed) and N.C. low ambient contact K58-1 (now open) to energize outdoor fan contactor K10.

15- N.O. contacts K10-1 close energizing outdoor fan B4 and N.C. contacts K10-2 open de-energizing compressor crankcase heater HR1.

Second Stage Cooling Demand (compressors B2 is energized):

16- Second stage cooling demand energizes Y2.

17- 24VAC is routed through TB34 to the heat pump control module A61.

18-A61 proves N.O. defrost switch S9 and N.C. defrost switch S104 to energize reversing valve L2 and low ambient relay K118.

19- N.C. contacts K118-1 open giving control of the K149 fan relay to the low ambient pressure switch S84.

20- A61 proves N.C. low pressure switch S88, N.C. freezestat S50, and N.C. high pressure switch S7 to energize compressor contactor K2.

21- Compressor protector A10 may be installed on J voltage units only.

22- N.O. contacts K2-1 close energizing compressor B2.

23-24VAC is routed through N.O. low ambient pressure switch S84 (now closed) and N.C. low ambient contact K118-1 (now open) to energize outdoor fan relay K149.

NOTE: If the outdoor temperature is above the A55 and A61 TP2 setpoint, fan relays K68 and K150 are also energized.

24- N.O. contacts K68-1 close energizing outdoor fan B5. N.O. contacts K149-1 close energizing outdoor fan B21. N.C. contacts K149-2 open de-energizing compressor crankcase heater HR2, and N.O. contacts K150-1 close energizing outdoor fan B22.

First Stage Heating Demand (compressors B1 and B2 are energized):

25- Heating demand energizes W1 in the thermostat.

26-24VAC is routed through TB34 to the main control module A55 and heat pump control module A61. After A55 and A61 proves N.C. low pressure switches S87 and S88, N.C. freezestat S49 and S50, and N.C. high pressure switch S4 and S7, compressor contactor K1 and K2 are energized.

NOTE: On first heating demand after unit has been in cooling mode, modules A55 and A61 will de-energize reversing valves L1 and L2, and low ambient relays K58 and K118. K58-1 and K118-1 N.C. contacts will take control away from low ambient pressure switches S11 and S84.

27-Compressor protector A9 and A10 are installed on J voltage units only.

28- N.O. contacts K1-1 and K2-1 close energizing compressors B1 and B2.

29-24VAC from the main control module A55 is routed through the N.C. low ambient contact K58-1 to energize outdoor fan contactor K10.

30- N.O. contacts K10-1 close energizing outdoor fan B4 and N.C. contacts K10-2 open de-energizing compressor crankcase heater HR1.

31-24VAC heat pump control module A61 is routed through N.C. low ambient contact K118-1 to energize outdoor fan contactor K149.

Second Stage Heating Demand (electric heat):

32- Second stage heating demand energizes W2 in the thermostat.

33- See sequence of operation for electric heat (diagrams A7 and A6).

NOTE: Outdoor fan contacts K68 and K150 are also energized through the A61 module. A55 and A61 TP2 setpoint is only in effect during cooling mode.

34- N.O. contacts K68-1 close energizing outdoor fan B5. N.O. contacts K149-1 close energizing outdoor fan B21. N.C. contacts K149-2 open de-energizing compressor crankcase heater HR2, and N.O. contacts K150-1 close energizing outdoor fan B22.

Defrost Mode: See Defrost Operation in Section I Unit Components-B Cooling Components.

SEQUENCE OF OPERATION
A2 DIAGRAM - GAS HEAT FOR "L" SERIES, 260 AND 470 UNITS

FIRST STAGE HEAT:

1 - Heating demand initiates at W1 in thermostat.

2 - 24VAC is routed through TB35 to the main control module A55. After A55 proves N.C. primary limit S10 and N.C. secondary limit S21 the combustion air blower relay K13 is energized.

3 - N.O. K13-1 contacts close allowing line voltage (or transformer T3 in 460V and 575V only) to energize combustion air blower B6.

4 - After the combustion air blower B6 has reached full speed, the combustion air proving switch (S18) contacts close. The A55 routes 24VAC through N.C. burner 1 flame rollout switch S47 and the closed contacts of the combustion air proving switch (S18) to energize the ignition module A3. After a 30 second delay A3 energizes the W1 terminal (low fire) of gas valve GV1.

5 - As steps 2, 3 and 4 occur, 24VAC is also routed to the gas valve control module A58. After A58 proves N.C. primary gas heat limit S99 and N.C. secondary limit S100 the combustion air blower relay K19 is energized.

6 - N.O. K19-1 contacts close allowing line voltage (or transformer T13 in 460V and 575V only) to energize combustion air blower B15.

7 - After the combustion air blower B15 has reached full speed, the combustion air proving switch (S45) contacts close. The A58 routes 24VAC through N.C. burner 2 flame rollout switch S69 and the closed contacts of the combustion air proving switch (S45) to energize the ignition module A12. After a 30 second delay A12 energizes the W1 terminal (low fire) of gas valve GV3.

SECOND STAGE HEAT:

8 - With first stage heat operating, an additional heating demand initiates W2 in the thermostat.

9 - A second stage heating demand is received by both A55 and A58 modules.

10 - Each module will energize the corresponding W2 terminal (high fire) of gas valves GV1 and GV3 respectively.

OPTIONAL LOW AMBIENT KIT (C.G.A. -50°C LOW AMBIENT KIT):

11 - Line voltage (or transformer T20 in 460V and 575V only) is routed through the low ambient kit fuses F20 and N.C. low ambient kit thermostats S60 and S61 to energize low ambient kit heater HR6.

END OF SECOND STAGE HEAT:

12 - Heating demand is satisfied. Terminal W2 is de-energized.

13 - Terminals W2 (high fire) of GV1 and GV3 are de-energized by the A55 and A58 Module.

END OF FIRST STAGE HEAT:

14 - Heating demand is satisfied. Terminal W1 is de-energized.

15 - Ignition module A3 is de-energized by A55 in turn de-energizing terminal W1 of GV1. Combustion blower relay K13 is also de-energized. At the same instant, ignition module A12 is de-energized by A58 module in turn de-energizing the W1 terminal of GV3. K19 combustion air blower relay is also de-energized.

SEQUENCE OF OPERATION
A7 DIAGRAM - EHA-15, 30, 45, 60, 90 - Y
A6 DIAGRAM - EHA-15, 30, 45, 60, 90 - G, J

Diagrams A7 and A6 are the EHA electric heat sections used in the LHA and LCA units. The Y voltage diagram (A7) use elements configured in a Wye. The G and J voltage diagram (A6) use elements configured in a Delta. Both diagrams A7 and A6 follow the following sequence of operation:

NOTE:Two electric heat sections are used in all 15kW through 90kW heaters. The heat sections are labelled first electric heat section (left side) and second electric heat section (right side). See figure 27.

NOTE: In the case of EHA 15 and 30kW, the second heat section (right side) is a slave (only has electric heat elements and a limit). In this case the A60 module, T2 transformer, and K9 heat relay are not used. Line voltage is supplied to elements in both heat section one (left side) and two (right side) by the contactors in heat section one (left side) and all control is through the A55 module.

HEATING ELEMENTS:

1 - Terminal strip TB3 is energized when the unit disconnect closes. TB3 supplies line voltage to electric heat elements HE1 through HE14. Each heating element is protected by fuse F3.

FIRST STAGE HEAT:

2 - Heating demand initiates at W1 in thermostat.

3 - 24VAC is routed through TB34 to the main control module A55. After A55 proves N.C. primary limits S15 (heat section one, left side), S107 (heat section two, right side), and redundant electric heat limit S63, the electric heat contactor K15 and heat relay K9 are energized.

4 - N.O. contact K15-1 closes allowing the first bank of elements in heat section one (left side) to be energized.

5 - At the same time, line voltage is routed through transformer T2, which provides 24VAC to the electric heat control module A60. A60 is energized when N.O. contacts K9-1 close. A N.O. contact in A60 closes,
energizing electric heat relay K17.

6 - N.O. contacts K17-1 close allowing the first set of elements in heat section two (right side) to be energized.

SECOND STAGE HEAT:

7 - With the first stage heat operating, an additional heating demand initiates at W2 in thethermostat.

8 - 24VAC is routed through the main control module A55, which in turn energizes the
electric heat contactor K16.

9 - N.O. contacts K16-1 close allowing the second set of elements in heat section one (left side) to be energized.

10 - Simultaneous with step eight, a N.O. contact in the electric heat control module A60 closes,
allowing 24VAC to energize electric heat contactor K18.

11 - N.O. contacts K18-1 close allowing the second set of elements in heat section two (right side) to be energized.

END OF SECOND STAGE HEAT:

12 - Heating demand is satisfied. Terminal W2 in the thermostat is de-energized.

13 - Electric heat contactors K16 and K18 are de-energized.

14 - The second set of electric heat elements in heat sections one (left side) and two (right side) are de-energized.

END OF FIRST STAGE HEAT:

15 - Heating demand is satisfied. Terminal W1 in the thermostat is de-energized.

16 - Electric heat contactors K15 and K17 are de-energized.

17 - The first set of electric heat elements in heat sections one (left side) and two (right side) are de-energized.

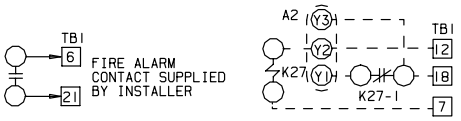
TB1	TERMINAL STRIP-24V CLASS II



THERMOSTAT HOOKUP FOR SELECTABLE OPTION #3, ECTO 5.04 ON MI-5 IMC BOARD (A55)

TO PROVIDE THREE COMPRESSOR STAGES. REQUIRES 3 HEAT,3 COOL THERMOSTAT AND K27 RELAY

1. S27 AND S52 ARE OPTIONAL
2. REMOVE JUMPER WHEN OCCUPIED-UNOCCUPIED OPERATION IS DESIRED. UNIT REMAINS IN OCCUPIED OPERATION WITH JUMPER
3. TB1-19 IS SERVICE RELAY OUTPUT (24VAC). IF USED CONNECT TO A INDICATOR LIGHT OR RELAY COIL (MAX 4VA)
4. J99/P99,J100/P100 AND J103/P103 ARE NOT USED ON-036,042,048,060,072,088 AND 100 UNITS
5. ALTERNATE REMOTE LOCATION OF RT6
6. USE S86 DEHUMIDISTAT AND K55 RELAY FOR OPTIONAL REHEAT SCHEME, SET PARAMETER 4.24 TO CONTROL VALVE 1 FOR SIMULTANEOUS HEATING AND COOLING
7. TB1-20 FOR DEHUMIDIFICATION CONTROL

DESIGNATES OPTIONAL WIRING
CLASS II FIELD WIRING

ELECTRONIC OR ELECTROMECHANICAL THERMOSTAT FOR "L" SERIES UNITS	
TEMPERATURE CONTROL SECTION C2	
Supersedes Form No. 532,583W	New Form No. 533,629W

© 2001 Litho U.S.A.

SEQUENCE OF OPERATION
C2 DIAGRAM - ELECTRONIC OR ELECTROMECHANICAL THERMOSTAT

POWER:

1 - Terminal strip TB34 energizes the thermostat components with 24VAC via TB1.

OPERATION:

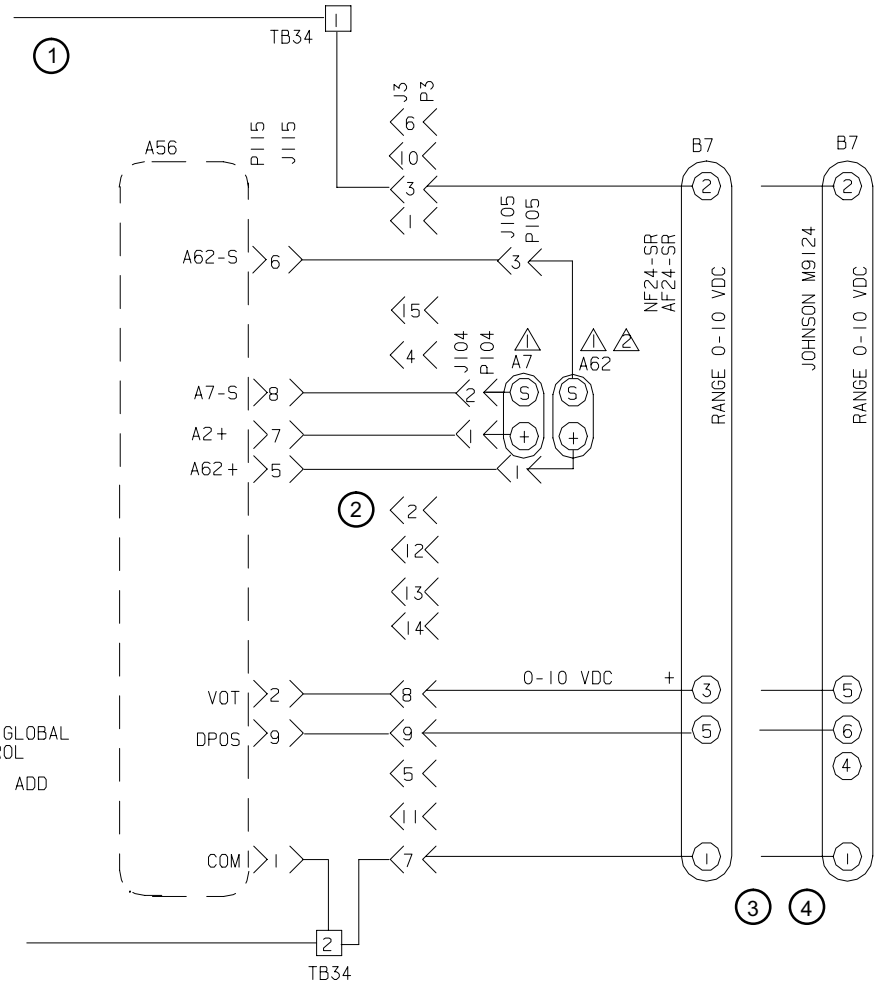
2 - The main control module A55 proves the optional N.O. filter switch S27(indicates dirty filter when closed), optional N.O. air flow switch S52(indicates no air [i.e. broken belt] system shuts down), and optional C.G.A. -50°C low ambient kit thermostat S59 (used in C.G.A. units only).

3 - The main control module A55 receives data from the supply and return smoke detectors A17 and A64, optional phase protection monitor A42, blower motor overload relay S42, discharge sensor RT6, return air sensor RT16, and the outdoor air sensor RT17.

4 - The main control module A55 receives data from the electronic thermostat A2 (Y1, Y2, W1, W2, G, OCP) and the CO_2 sensor (if economizer is used) via terminal strip TB1. A55 energizes the appropriate components.

D1 diagram "L" SERIES ECONOMIZER

DESCRIPTION	
KEY	COMPONENT
A7	SENSOR-SOLID STATE ENTHALPY
A56	PANEL-ECONOMIZER
A62	SENSOR-ENTHALPY, INDOOR
B7	MOTOR-DAMPER
J3	JACK-UNIT ECONOMIZER
J104	JACK-SENSOR, OUTDOOR ENTHALPY
J105	JACK-SENSOR, RETURN AIR ENTHALPY
J115	JACK-ECONOMIZER, OUTPUT
P3	PLUG-UNIT ECONOMIZER
P104	PLUG-SENSOR, OUTDOOR ENTHALPY
P105	PLUG-SENSOR, RETURN AIR ENTHALPY
P115	PLUG-ECONOMIZER, OUTPUT
TB34	TERMINAL STRIP-TRANSFORMER TI



⚠1 DELETE A7 AND A62 (IF USED) FOR EITHER GLOBAL ENTHALPY OR SENSIBLE TEMPERATURE CONTROL

⚠2 FOR UNIT DIFFERENTIAL ENTHALPY CONTROL, ADD A62 RETURN AIR ENTHALPY SENSOR

NOTE: THIS DIAGRAM USED ONLY WHEN ECONOMIZER OR MOTORIZED OUTDOOR AIR DAMPERS ARE INSTALLED

SEQUENCE OF OPERATION
D1 DIAGRAM - "L" SERIES ECONOMIZER

POWER:

1 - Terminal strip TB34 energizes the economizer components with 24VAC.

OPERATION:

2 - The main control module A55 along with outdoor enthalpy sensor A7 and indoor enthalpy sensor A62 (if differential enthalpy is used) communicates to the economizer control module A56 when to power the damper motor B7.

3 - The economizer control module A56 supplies B7 with 0 - 10 VDC to control the positioning of economizer.

4 - The damper actuator provides 2 to 10 VDC position feedback.
